Ms. Linda Bassi  
Colorado Water Conservation Board  
1313 Sherman Street, Room 721  
Denver, Colorado 80203

Dear Ms. Bassi:

The Bureau of Land Management (BLM) is writing this letter to formally communicate its recommendation for an instream flow water right on Fourth of July Creek, located in Water Division 4.

**Location and Land Status.** Fourth of July Creek originates near Powderhorn Lakes within the Powderhorn Wilderness Area, approximately 23 miles south of Blue Mesa Reservoir. This reach begins at the headwaters of the creek and extends downstream to the headgate of the Carris Thompson Ditch, a distance of approximately 5.8 miles. The BLM manages approximately 4.6 miles of this reach, while 1.2 miles are in private ownership.

**Biological Summary.** Fourth of July Creek is a cold-water, high gradient stream. It flows through a canyon with a valley floor approximately one-eighth mile in width. The stream cuts through alluvial deposits in the narrow valley and is confined by bedrock in many locations. The stream generally has small-sized substrate, consisting of gravels, small cobbles and small boulders. The stream has a good mix of pools, small riffles and runs. While deep pool habitat is absent, the existing pools are sufficient for overwintering fish.

Fisheries surveys have revealed a self-sustaining population of brook trout. Intensive macro-invertebrate surveys have not been conducted, but spot samples have revealed various species of mayfly, caddisfly and stonefly.

The riparian community is generally comprised of blue spruce, aspen, willow species and alder. The riparian community is in very good condition and provides abundant shading and cover for fish habitat.

**R2Cross Analysis.** The BLM collected the following R2Cross data from Fourth of July Creek:

Cross Section Date	Discharge Rate	Top Width	Winter Flow Recommendation (meets 2 of 3 hydraulic criteria)	Summer Flow Recommendation (meets 3 of 3 hydraulic criteria)
07/18/2013 #1	0.42 cfs	8.56 feet	0.83 cfs	1.10 cfs
07/18/2013 #2	0.37 cfs	6.00 feet	0.40 cfs	Out of range
07/25/2014 #1	0.40 cfs	10.14 feet	0.65 cfs	Out of range
07/25/2014 #2	0.39 cfs	9.00 feet	0.81 cfs	Out of range

Averages:      0.67 cfs                          1.10 cfs

*Note: 1.1 cubic feet per second is within the confidence interval for the data set collected on 07/18/2013. 1.1 cubic feet per second provides 0.94 feet per second average velocity, which is very close to the 1.0 feet per second criteria used by instream flow program.*

The BLM's analysis of this data, coordinated with Colorado Parks and Wildlife, indicates that the following flows are needed to protect the fishery and natural environment to a reasonable degree.

1.1 cubic feet per second is recommended during the snowmelt runoff period from April 1 to July 31. This recommendation is driven by the average velocity criteria. This creek is narrow and has limited physical habitat, so it is important to protect a flow rate that makes most of this habitat available to the fish population while they are completing critical life history functions during the warm weather months.

0.6 cubic feet per second is recommended from August 1 to March 31. This recommendation is driven by the average velocity criteria. This flow rate should prevent pools from freezing, allowing the fish population to successfully overwinter. Even though the base flow in this creek is small, it is extremely consistent, allowing the fishery to persist.

**Water Availability.** The BLM recommends relying upon three sources of data for water availability analysis. United States Geological Survey (USGS) Gage 09122000 (Cebolla Creek at Powderhorn, CO) measures flow from the next watershed to the east of Fourth of July Creek. Elevation and precipitation patterns for the Cebolla Creek watershed are very similar to the Fourth of July Creek watershed. A basin apportionment analysis could be performed to derive flow rates for Fourth of July Creek. In addition, Streamstats should be consulted. The Streamstats model produces similar estimates of baseflow as basin apportionment calculation, but the BLM believes the Streamstats model may overestimate snowmelt runoff flows. Finally, diversion records for the Carris Thompson Ditch can be consulted to help confirm the duration of the snowmelt runoff period.

The BLM is aware of two water rights within the proposed instream flow reach:

Fourth of July Feeder Pipeline – 2.0 cfs

Fourth of July Pond – 1.8 acre feet

The feeder pipeline maintains the off-channel pond at full capacity and maintains the water quality within the pond. The pond appears to be operated on an inflow-equals-outflow basis, so any water that is not consumed by pond evaporation is immediately returned to Fourth of July Creek.

**Relationship to Land Management Plans.** The headwaters of this creek are located within the Powderhorn Wilderness Area. The BLM manages the wilderness area to maintain stream habitats in a pristine and unimpaired condition. In addition, the portion of the creek within the wilderness area has been determined to be an “Outstanding Water of The State of Colorado” because of its excellent water quality. Establishing an instream flow water right would assist in meeting these objectives. Appropriation of an instream flow water right would also assist BLM in long-term management of riparian values and important fishery values.

Data sheets, R2Cross output, fishery survey information and photographs of the cross section were included with BLM’s draft recommendation in February 2015. We thank both Colorado Parks and Wildlife and the Colorado Water Conservation Board for their cooperation in this effort.

If you have any questions regarding our instream flow recommendation, please contact Roy Smith at 303-239-3940.

Sincerely,

Brian St. George  
Deputy State Director  
Resources and Fire

# Gunnison Field Office Stream Surveys

## July 2014

### Fourth of July Creek – Water Code: #45351

Fourth of July Creek, located on BLM lands administered by the Gunnison Field Office, was sampled on July 16, 2014. Fourth of July Creek is tributary to the Lake Fork Gunnison River. Sampling was done to determine species composition and obtain a population estimate. A two-pass removal population estimate was completed. The stream was sampled using one backpack electroshocking unit. Brook trout (*Salvelinus fontinalis*), was the only species seen or collected. Personnel present included Dan Brauch (CPW), Gregor Dekleva, Tom Fresques, and Kristen Doyle (BLM).

**Habitat (Riparian):** Diverse, dense, lush vegetation. Spruce, ponderosa pine, rocky mountain juniper, aspen, alder, willow, sedge

3.2'
4.8.2'
5.6.2'
Avg:

**Habitat (Stream):** Channel type A, lots of woody debris, some good pools about 1.5 deep. Gravel, cobble, and rock substrate.

**Discussion:**

This small stream contained a good mix of small pools, riffles and runs. Large deep pools were absent but existing pools are sufficient to overwinter and oversummer resident brook trout. Abundant woody debris helps to form and maintain some of the better pools. Substrate consists of some gravels and cobbles with rock. Riparian habitat is dense and lush consisting of blue spruce, ponderosa pine, rocky mountain juniper, aspen, alder, willow, and sedges. The stream is steep gradient and appears to be a Rosgen A/B channel type.

Sampling on this stream was conducted to determine species composition and obtain a population estimate. In addition, an Instream Flow recommendation may be pursued on this stream. Based on the sampling, the site specific population estimate of fish  $\geq 120$  mm Total Length within the sample reach (300 feet) is 24 fish + or - 5 at the 95% confidence interval. The extrapolated population estimate of fish  $\geq 120$  mm Total Length is 417 fish + or - 96 fish per mile at the 95% confidence interval.

**Recommendations:**

- Consider sampling further up the drainage to determine upstream distribution limits and look for upstream movement barriers – the stream, although small, could be a candidate for future cutthroat trout reclamation
- Periodically monitor stream and riparian habitats
- Consider instream flow recommendation for this stream

Fourth of July Creek  
July 29, 2015  
Post Site Visit Notes, by Brian Epstein

General:

Moved from downstream to upstream, taking GPS points and pictures.

GPS Point: 4JulyCrObs001, 10:03

Pictures 224 and 225: The diversion splitter box. The only active ditch on the observed reach. The box functions as a measuring device, strainer, and spillback. A pipe from the diversion comes into the upstream side. The gate opens to a pipe that spills back to Fourth of July Creek. The sharp crested rectangular weir measures water into the strainer which continues into a pipe.

Picture 239: Staff plate in rectangular sharp crested weir, reading 0.23 feet.

GPS Point: 4JulyCrObs002, 10:08

Picture 226: Zero outflow from the spillback pipe, during visit.

GPS Point: 4JulyCrObs003, 10:17

Picture 227 and Video 228: Ditch diversion structure and headgate diverting the entire creek, during visit.

Picture 229: Immediately downstream of structure, tiny water seeping through and around.

GPS Point: 4JulyCrObs004, 10:32

Picture 230: Off channel pond, from upstream looking downstream.

GPS Point: 4JulyCrObs005, 10:38

Pictures 231 and 232: Off channel pond outlet. During site visit, zero outflow.

GPS Point: 4JulyCrObs006, 10:48

Pictures 233-235: Off channel pond, in channel diversion box and check structure.

GPS Point: 4JulyCrObs007, 11:20

Pictures 236, 238 and video 237: Water flowing at furthest upstream observation point. According to Andrew Breibart, USFS Hydrologist, there are no functioning structures upstream of this observation.

Fourth of July Creek Field Notes May 21, 2015

11:30 turn off of 149 to site

- closed and locked gate marked private property  
encountered

- no cellular reception in area

11:45 departed turn off

Brian Epstein
