

DRAFT RECOMMENDATION – January 2016 Version

Ms. Linda Bassi
Colorado Water Conservation Board
1313 Sherman Street, Room 721
Denver, Colorado 80203

Dear Ms. Bassi:

The Bureau of Land Management (BLM) is writing this letter to formally communicate its recommendation for an instream flow water right on West Fork Terror Creek, located in Water Division 4, pursuant to the rules of the Colorado Instream Flow and Natural Lake Level Program. The United States Forest Service is a joint recommending agency on this creek, and will be submitting a separate recommendation letter.

Location and Land Status. West Fork Terror Creek originates approximately 12 miles northwest of Paonia on the south slopes of the Grand Mesa, near Mount Darline. This recommendation covers a reach that begins at the headwaters of the creek and extends to the confluence with East Fork Terror Creek. This stream reach covers a distance of approximately 8.0 miles. The U.S. Forest Service manages 7.0 miles of this reach, the BLM manages 0.5 miles of this reach, and 0.5 miles are under private ownership. (*Jedd – Can you check these mileages on the GIS system?*)

Biological Summary. West Fork Terror Creek is a cold-water, high gradient stream. It flows through a narrow canyon that is typically less than 1,000 feet in width. The stream is generally constrained by bedrock, especially in locations where the stream comes close to the canyon walls. The stream generally has large-sized substrate, ranging from four-inch cobbles to boulders up to two feet in diameter. The stream has a high percentage of pool habitat, but sufficient riffle and side channel habitat exists to support salmonid fish reproduction.

Fisheries surveys have revealed self-sustaining populations of speckled dace and native cutthroat trout. Genetic testing has revealed that the trout population is comprised of genetically pure Colorado River Cutthroat Trout of the Colorado-Gunnison (GB) lineage, and that fish density is high. As such, the fishery has been identified as a core conservation population by the Colorado River Cutthroat Conservation Team. Pending a status review, this population is currently being provided interim protection as a threatened species under the Endangered Species Act.

The riparian community in West Fork Terror Creek is generally comprised of willow species, alder, blue spruce, and narrowleaf cottonwood. In general, the riparian community is in very good condition, provides adequate shading and cover for fish habitat, and provides stream stability during flood events.

R2Cross Analysis. The BLM collected the following R2Cross data from Terror Creek:

Cross Section Date	Discharge Rate	Top Width	Winter Flow	Summer Flow
--------------------	----------------	-----------	-------------	-------------

			Recommendation (meets 2 of 3 hydraulic criteria)	Recommendation (meets 3 of 3 hydraulic criteria)
08/15/2013 #1	1.11 cfs	16.4 feet	1.03 cfs	Out of range
07/23/2014 #1	1.52 cfs	26.3 feet	2.63 cfs	Out of range
07/23/2014 #2	1.46 cfs	16.4 feet	1.13 cfs	Out of range
07/23/2014 #3	1.70 cfs	12.7 feet	Out of range	Out of range
07/23/2014 #4	1.65 cfs	14.6 feet	1.65 cfs	2.15 cfs

Averages: 1.61 cfs 2.15 cfs

BLM's analysis of these data, coordinated with Colorado Parks and Wildlife, indicates that the following flows are needed to protect the fishery and natural environment to a reasonable degree, as defined by the CWCB instream flow program.

2.2 cubic feet per second is recommended for the snowmelt runoff period from April 1 to July 15. This recommendation is driven by the wetted perimeter and velocity criteria. This flow rate will provide important physical habitat during a time of year when the fish population is completing key life cycle functions.

1.6 cubic feet per second is recommended during the base flow period between July 16 and March 31. This recommendation is driven by the wetted perimeter and average depth criteria. This flow rate should prevent excessively high stream temperatures during summer and should prevent icing in pools, allowing the fish population to successfully overwinter.

Please note that the recommended flow rates are preliminary. These recommended flow rates may change, based upon additional data collection and further refinement of the R2Cross methodology to the habitat and fish species found in this stream.

Water Availability. The BLM recommends relying upon multiple data sources to confirm water availability. USGS Gage Station 09132985 (East Fork Terror Creek Below Cottonwood Stomp near Bowie, CO) has records from 2001 to the present. Although this gage does not measure flows in the recommended stream reach, it is a roughly comparable watershed located immediately to the east of the West Fork Terror Creek watershed. The value of this gage data is also limited by lack of data during the winter because of icing issues. USGS Gage 09132995 (Terror Creek at Mouth Near Bowie, CO) provides data from 2001 to the present. This gage is heavily affected by the operation of Fawcett Ditch, Terror Ditch, and the Fire Mountain Canal, but it can generally be used to confirm the magnitude of snowmelt runoff flows, and the fact that the watershed experiences flows during winter.

The only absolute water right that the BLM is aware of within the proposed instream flow reach is the Overland Ditch, owned by Overland Ditch and Reservoir Company . The water rights for the ditch allow the company to divert up to a total of 150 cfs from the Hubbard, Terror, Roadmap, Lower Cow Creek, and Leroux Creek drainages.

The BLM is also aware of 85 cfs of undeveloped conditional water rights associated with the Grand Mesa Canal. These rights appear to be owned by the Grand Mesa Water Conservancy District and North Fork Water Conservancy District.

Relationship to Land Management Plans. The BLM land use plan for this area calls for actions to maintain and enhance riparian and fisheries habitat. In general, any proposed new land use, such as right-of-way corridors or mineral development, must be implemented with no surface occupancy to avoid impacts to the creek. Any proposed land uses along this creek are also carefully reviewed and mitigated to prevent impacts to native cutthroat trout, which appear on BLM's sensitive species list. Establishing an instream flow water right pursuant to the Colorado Instream Flow and Natural Lake Level Program would assist in meeting these objectives.

Data sheets, R2Cross output, fishery survey information, and photographs of the cross section were included with BLM's draft recommendation in February 2016. We thank both Colorado Parks and Wildlife and the Colorado Water Conservation Board for their cooperation in this effort.

If you have any questions regarding our instream flow recommendation, please contact Roy Smith at 303-239-3940.

Sincerely,

Brian St. George
Deputy State Director
Resources and Fire

CROSS SECTION DATA ANALYSIS

West Fork Terror Creek

History of Fish Inventory Efforts

The observed presence of cutthroat trout in West Fork Terror Creek dates to at least 1978, when Colorado Parks and Wildlife (CPW) (then known as the Colorado Division of Wildlife) sampling efforts yielded cutthroat trout and speckled dace at two locations near the up- and downstream end West Fork Terror Creek as it flows through the Action Area (CDOW 1978). Following the 1978 sampling effort, more than two decades passed before the next available fish sampling was conducted in 2005 by the USFS. This sampling effort examined West Fork Terror Creek and Cunningham Creek (a tributary to West Fork Terror Creek that is located upgradient from the Action Area). These sampling efforts identified 166 adult Colorado Cutthroat Trout per mile in West Fork Terror Creek and 245 adult Colorado Cutthroat Trout per mile in Cunningham Creek. These two populations were assigned a genetic purity rating of “A”, indicating low rates of hybridization with other cutthroat subspecies or rainbow trout (James and Speas 2005).

The USFS conducted additional West Fork Terror Creek fish sampling in 2010. This sampling occurred following publication of genetic research that reported a genetic signature shared by the federally listed greenback cutthroat trout and cutthroat trout in the GMUG. The GMUG cutthroat trout that shared this genetic signature with greenback cutthroat trout were identified as greenback-lineage cutthroat trout (GBCT). The 2010 sampling efforts resulted in estimates of 408 +/- 38 fish/km and 167 +/- 36 adult fish/km at a lower West Fork Terror Creek sampling location and 424 +/- 36 fish/km and 73 +/- 13 adult fish/km at an upper West Fork Terror Creek sampling location. In addition to fish density measurements, this study included analysis of DNA to determine the genetic lineage. This analysis identified the West Fork Terror Creek and Cunningham Creek cutthroat trout populations as Lineage GB or Colorado – Gunnison lineage cutthroat trout (Dare 2010).

Bowie Coal conducted sampling at five locations along West Fork Terror Creek in 2012. This effort produced density estimates ranging from 319(+/- 24) to 659(+/- 24) adult fish per mile. Further, genetic analysis confirmed the earlier finding of West Fork Terror Creek cutthroat trout as Colorado – Gunnison lineage cutthroat trout.

Water: West Fork Terror Creek 1

Date: 8/17/2010

Location: RD 703

Drainage: Gunnison

Water Code:

UTM Zone: 13 S
