Ms. Linda Bassi
Colorado Water Conservation Board
1313 Sherman Street, Room 721
Denver, Colorado 80203

Dear Ms. Bassi:

The Bureau of Land Management (BLM) is writing this letter to formally communicate its recommendation for an instream flow water right on East Fork Little Cimarron River, located in Water Division 4.

Location and Land Status. East Fork Little Cimarron River originates near the north boundary of the Uncompahgre Wilderness, approximately six miles east of Silver Jack Reservoir. This reach begins at the headwaters of the creek and extends downstream to the confluence with the Little Cimarron River, a distance of approximately 6.4 stream miles. The BLM manages approximately 1.33 miles of this reach, the U.S. Forest Service manages approximately 2.9 miles, and approximately 2.21 miles are in private ownership.

Biological Summary. East Fork Little Cimarron River is a cold-water, high gradient stream. It flows through a canyon with a valley floor averaging one-eighth mile in width. In the upper four miles, the stream flows through several meadows with alluvial deposits. In the lower two miles, it flows through a narrow valley and is confined by bedrock. The stream generally has medium to large-sized substrate, consisting of gravels, small cobbles, and small boulders. The stream has a good mix of pools, small riffles, and runs.

Fisheries surveys have revealed a self-sustaining population of brook trout. Intensive macro-invertebrate surveys have not been conducted, but spot samples have revealed various species of mayfly, caddisfly, and stonefly.

In open meadow areas, the riparian community is generally comprised of willows, grasses, and sedges. In more confined reaches, the riparian community is generally comprised of blue spruce, aspen, willow species, and alder. The riparian community is in very good condition, and provides shading and cover for fish habitat.

R2Cross Analysis. The BLM collected the following R2Cross data from East Fork Little Cimarron River:

Cross Section Date	Discharge Rate	Top Width	Winter Flow Recommendation (meets 2 of 3 hydraulic criteria)	Summer Flow Recommendation (meets 3 of 3 hydraulic criteria)
07/28/2015 #1	0.45 cfs	11.50 feet	0.59 cfs	Out of range
07/28/2015 #2	0.49 cfs	11.35 feet	0.82 cfs	Out of range
07/12/2016 #1	0.64 cfs	11.30 feet	1.13 cfs	Out of range
07/12/2016 #2	0.58 cfs	10.45 feet	0.65 cfs	Out of range
06/28/2017 #1	1.76 cfs	23.59 feet	2.40 cfs	2.84 cfs
06/28/2017 #2	2.21 cfs	12.50 feet	1.63 cfs	2.84 cfs

Averages: 1.20 cfs

2.84 cfs

BLM's analysis of this data, coordinated with Colorado Parks and Wildlife, indicates that the following flows are needed to protect the fishery and natural environment to a reasonable degree.

2.80 cubic feet per second is recommended during the snowmelt runoff period from May 1 to June 30. This recommendation is driven by the average velocity criteria. This creek is narrow and has limited physical habitat, so it is important to protect a flow rate that makes most of this habitat available to the fish population while they are completing critical life history functions.

1.2 cubic feet per second is recommended from July 1 to December 31. This recommendation is driven by the depth and wetted perimeter criteria. As mentioned above, this creek is narrow and has very limited physical habitat. This flow rate will allow passage between pools for full usage of the limited habitat.

1.0 cubic per second is recommended from January 1 to April 30. This flow is recommended because of naturally limited water availability. 1.0 cubic feet per second should prevent pools from freezing, allowing the fish population to successfully overwinter. Even though the base flow in this creek is small, it is extremely consistent, allowing the fishery to persist.

Water Availability. The BLM recommends relying upon Streamstats for water availability analysis because this stream has not historically been gaged. BLM does not recommend relying upon stream gages located along the Cimarron River. The data collected by those gages is heavily influenced by reservoir releases, irrigation diversions, and irrigation returns flows. These gages would not accurately reflect the hydrology of the East Fork Little Cimarron River watershed, which has not been developed for agricultural purposes.

The BLM is not aware of any water rights within the proposed instream flow reach.

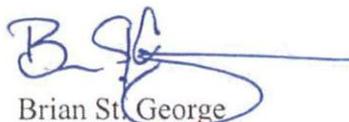

Relationship to Land Management Plans. The BLM land use plan calls for managing this creek to support fishery, riparian, and wildlife values and to continue meeting land health

standards. Establishing an instream flow water right would assist in meeting these objectives.

Data sheets, R2Cross output, fishery survey information, and photographs of the cross section were included with BLM's draft recommendation in February 2018. We thank both Colorado Parks and Wildlife and the Colorado Water Conservation Board for their cooperation in this effort.

If you have any questions regarding our instream flow recommendation, please contact Roy Smith at 303-239-3940.

Sincerely,

A handwritten signature in blue ink, appearing to read "B. St. George", with a long horizontal flourish extending to the right.

BLM Gunnison Field Office Stream Surveys

June 2017

East Fork Little Cimarron River – Water Code 44892

Introduction:

The East Fork of the Little Cimarron River is a small mountain stream located to the west of Gunnison. It is a tributary to the Little Cimarron River, which is a part of the Gunnison River watershed. The river itself is mostly on private and the only access is by a private road that ends at a private cabin (figures 1 and 2). Survey records for this stream are unknown.

Methods:

The stream was surveyed using one backpack shocker and one netter. Only a presence/absence survey was performed in conjunction with a survey completed by hydrologists to gain instream flows on BLM for the Colorado Waterboard. The survey reach was 475 ft in length. Personnel present for the survey was Russ Japuntich Fish Biologist and Josh Ryan Fisheries Technician.

Analysis:

A total of 35 brook trout (*Salvelinus fontinalis*) were captured during the survey (table 1). Brook trout lengths ranged from 83-220 mm and weights ranged from 3-114g (figures 3 and 4).

Discussion:

Efficiency was good, with several fish captured in a short stretch. The stream was narrow with some decent pool habitat and undercut banks. The fish seemed fairly healthy and proportionately sized for the stream. An awesome stream that could be a potential candidate for cutthroat reintroduction.

SUMMARY SHEET

MEASURED FLOW (Qm)= 0.45 cfs
CALCULATED FLOW (Qc)= 0.45 cfs
(Qm-Qc)/Qm * 100 = 0.0 %

MEASURED WATERLINE (WLm)= 5.20 ft
CALCULATED WATERLINE (WLc)= 5.20 ft
(WLm-WLc)/WLm * 100 = 0.0 %

MAX MEASURED DEPTH (Dm)= 0.35 ft
MAX CALCULATED DEPTH (Dc)= 0.35 ft
(Dm-Dc)/Dm * 100 = 0.0 %

MEAN VELOCITY= 0.35 ft/sec
MANNING'S N= 0.262
SLOPE= 0.041 ft/ft

.4 * Qm = 0.2 cfs
2.5 * Qm= 1.1 cfs

CWCB ISF site visit notes

Collected using the ESRI Survey123 app on a Samsung tablet

Location description	East Fork Little Cimarron
Water division	4
Visit date	6/27/2018
Collected by	Jack Landers
General observations	Hiked from private land to BLM land. Channel flows through open meadows on PVT before entering steep, narrow canyon. Channel steepens from approx 3-5% to 5-7%. Substrate is primarily large boulders and cobbles. Lots of large wood in channel. Channel appears
Wildlife observations	Observed lots of fish, confirmed brook trout for many fish throughout section observed. Good pool habitat formed by wood and large boulders, multiple fish in each pool. Larger pools had 15 or more fish. Spawning gravels may be limiting factor due to large substrate.
Location	13N 285900 4239668
