January 17, 2020

Ms. Linda Bassi
Mr. Jeff Baessler
Colorado Water Conservation Board
1313 Sherman Street
Denver, CO 80203

Dear Ms. Bassi and Mr. Baessler,

High Country Conservation Advocates (HCCA) submits this instream flow recommendation for Elk Creek, located in Gunnison County, Water Division 4.

HCCA's mission is to protect the health and natural beauty of the land, rivers, and wildlife in and around Gunnison County. Many of our members live and work here and enjoy recreational opportunities and a quality of life that is preserved by our valley's wildlife, habitat, and water resources. HCCA's 28 year-old water program has a long history of protecting waters in the Upper Gunnison Basin and in developing an environmental voice within key regional and state forums. In recent years, HCCA has partnered with the Bureau of Land Management to support instream flow proposals on the Slate River and Oh-Be-Joyful Creek. In 2016 HCCA submitted proposals to protect updated instream flows for Coal Creek and Brush Creek. HCCA partnered with Western Resource Advocates in 2017 to submit an instream flow proposal on Dutchman Creek. More recently HCCA submitted instream flow proposals for Gold Creek, Cement Creek and Spring Creek, all in Division 4.

The headwaters of Elk Creek originate on United States Forest Service (USFS) lands in Gunnison County. The Elk Creek riparian area consists primarily of mixed pine and spruce forest. In the past, Elk Creek struggled to sustain a fishery. However, the natural environment has improved to support a brook trout fishery. Stream sampling conducted by the Environmental Protection Agency (EPA) in 2008 recorded brook in the lower portion of Elk Creek. While collecting water quality samples from Elk Creek in 2018, Coal Creek Watershed Coalition staff observed a tiger salamander and macroinvertebrates.

Elk Creek does not have an existing instream flow protection. From the headwaters of Elk Creek to its confluence with Coal Creek is approximately 2.7 miles.

HCCA has coordinated with local consultants to arrive at a preliminary instream flow recommendation that would protect a headwaters fishery on a reach that is currently unprotected. In considering this application, the Colorado Water Conservation Board (CWCB) has an opportunity to protect an important stream ecosystem by moving forward with an instream flow protection that would preserve the natural environment to a reasonable degree.

Enclosed you will find copies of data sheets from Colorado Parks and Wildlife (CPW) reflecting the Elk Creek aquatic environment. We have included EPA flume records for additional reference. We have attached R2Cross modeling runs, stream photos, and maps of the relevant reach. If you have any further questions regarding this recommendation, please feel free to contact Julie Nania at (509) 999-0012. HCCA thanks CPW and the CWCB for their support in developing this recommendation.

Sincerely,

Julie Nania
High Country Conservation Advocates
Water Director

Enclosure

ENCLOSURE - INSTREAM FLOW RECOMMENDATIONS FOR ELK CREEK

Below is a description of the proposed instream flow. Additional details can be found in Attachments A-E.

Location

Elk Creek is located within the Coal Creek watershed (HUC-12: 140200010204) in Gunnison County, Water Division 4 (Attachment A). The headwaters originate on the southwest side of Mount Emmons in Elk Basin, coming down from Scarp Ridge. Elk Creek flows south-southeast to the confluence with Coal Creek approximately 6 miles west of the Town of Crested Butte. The Elk Creek watershed is about 1.7 square miles and is on the Mt. Axtell United States Geologic Survey quad map (Attachment E).

The stream segment identified for the proposed instream flow appropriation is approximately 2.7 miles and starts on the southwest side of Mt. Emmons and terminates at the confluence of Elk Creek and Coal Creek.

Table 1. Land Status in the Elk Creek Watershed.

Upper Terminus[1]	Lower Terminus	Total Length (miles)	Land Ownership	
			Private (%)	Public (%)[2]
Headwaters	Confluence with Coal Creek	2.7	Riparian Corridor[3] 15%	Riparian Corridor 85%
			Watershed Composition 16%	Watershed Composition 84%

1. The terminus for the proposed instream flow water right may need to be adjusted based upon physical and legal availability.
2. The public land in the Elk Creek Watershed is managed by the USFS.
3. The riparian corridor ownership percentages were calculated using stream length.

The Elk Creek watershed is 84 percent public land managed by the United States Forest Service (USFS). The riparian corridor of the proposed segment is 85 percent public land managed by the USFS.

Existing Instream Flow Right

Elk Creek does not have an existing instream flow water right.

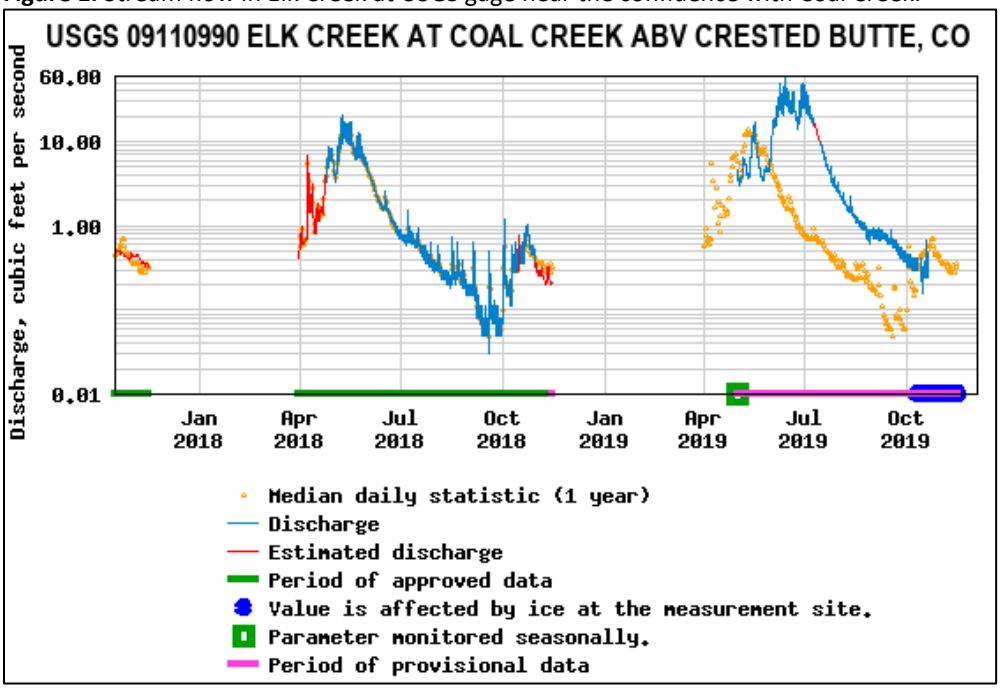
Water Availability

Physical Availability

EPA contracts USGS to operate a seasonal stream gage on Elk Creek (USGS gage 09110990). The period of record for the gage is October 17, 2017 to present. The existing period of record suggests that flows in Elk Creek range from approximately 0.05 cfs to 60 cfs (Figure 1). The existing period of record includes

2018 which was an exceptionally dry year and 2019 which had a large snowpack and large and late season runoff. There are no existing diversions on Elk Creek.

Figure 1. Stream flow in Elk Creek at USGS gage near the confluence with Coal Creek.



Due to the limited period of record and seasonal operation of the Elk Creek gage, HCCA also relied on R2Cross assessments and StreamStats. StreamStats is an online program developed by the USGS in collaboration with the CWCB. StreamStats uses a regionally specific regression equation based on nearby active and historical stream gages to estimate stream flows at user-selected locations (Attachment D).

The R2Cross results from 2019 support a 0.2 cfs winter instream flow for Elk Creek. StreamStats reports a mean monthly flow of 0.90 cfs for October and a mean monthly flow of 0.65 cfs for April (See Attachment D). The gage record suggests there is water available to satisfy the proposed winter flow rate of 0.2 cfs.

The R2Cross results from 2019 did not provide a summer flow recommendation for Elk Creek. Additional surveys will be completed in 2020 to develop the summer recommendation. StreamStats reports a mean monthly flow of 6.49 cfs in May and 1.23 cfs in September, with a peak mean monthly flow of 16.5 cfs in June (See Attachment D).

Legal Availability

Mount Emmons Mining Company holds substantial conditional water rights for mining purposes. However, MEMC has declared in a memorandum of understanding with the Town of Crested Butte, Gunnison County, and several state agencies that they do not intend mine on the adjacent properties.

Biological Summary

Elk Creek is a cold-water, high gradient stream. The stream generally has cobble-sized substrate along with number of large boulders and ample woody debris. There is a mixture of cascades and small pools. Copley Lake, a shallow natural lake and wetland, is tributary to Elk Creek. Flows in Elk Creek support a robust riparian area. The riparian community is primarily a pine-spruce forest. The riparian zone is in good condition and provides shade and cover for the extant aquatic life community.

Water quality in Elk Creek has been impacted by historic mining. In recent years the EPA has done substantial reclamation work at the Standard Mine Superfund Site, near the headwaters of Elk Creek, to improve water quality in Elk Creek.

Sampling efforts in Elk Creek have identified a brook trout population in the lower portion of Elk Creek. In 2006, EPA found approximately 800 fish per hectare in lower Elk Creek. Prior to the reclamation effort, the fish density in Elk Creek was slightly lower than the fish density in creeks where little to no mining occurred (i.e. Splains Gulch). In a 2016, survey CPW identified brook trout in lower Elk Creek (Attachment B). Elk Creek is not stocked.

While the proponent was conducting the R2Cross assessment numerous macroinvertebrates were present on submerged rocks (see Photo 1). While collecting water quality samples from Elk Creek in 2018, Coal Creek Watershed Coalition staff observed a tiger salamander and macroinvertebrates (Photo 2).

Photo 1. An EPT taxa macroinvertebrate found on a large cobble in Elk Creek in October 2019.

Photo 2. A tiger salamander in the Elk Creek riparian area during a large rainstorm in October 2018.

Preliminary R2CROSS Analysis

HCCA has relied on the expertise of Alpine Environmental Consultants to interpret output from the R2Cross model and develop a preliminary instream flow recommendation that will protect Elk Creek's natural environment to a reasonable degree.

One R2Cross field survey was completed on October 3, 2019. R2Cross data entry, analysis, and interpretation were completed following fieldwork. These data were used to create the preliminary instream flow recommendations for Elk Creek (Table 2). The R2Cross output and field forms are attached for review (Attachment C).

Based on R2Cross results (Table 2; and Attachment C), 0.2 cfs is recommended to protect the Elk Creek natural environment during winter months. This flow satisfies two of the required hydrologic criteria. Additional R2Cross surveys will be completed in 2020 to identify the summer flow recommendation (which requires that all three hydrologic criteria are met).

The seasonal dates for the winter and summer rates will be developed following a more detailed review of physical water availability.

Table 2. R2CROSS analysis summary and preliminary instream flow recommendations.

Cross Section (Date & Location)	Measured Discharge (cfs)	Bankfull Top Width (ft)	Winter Flow Recommendation (cfs)	Summer Flow Recommendation[1] (cfs)
Elk Creek (10-3-19)	0.12	8.8	0.2	TBD[2]

1) The proposed dates for the summer flow recommendations are tentatively May 1 to September 30. The dates will be revised based upon additional review of physical and legal water availability.
2) To be determined. Additional R2Cross assessments will be completed in 2020 to determine an appropriate summer flow recommendation.

Photographs

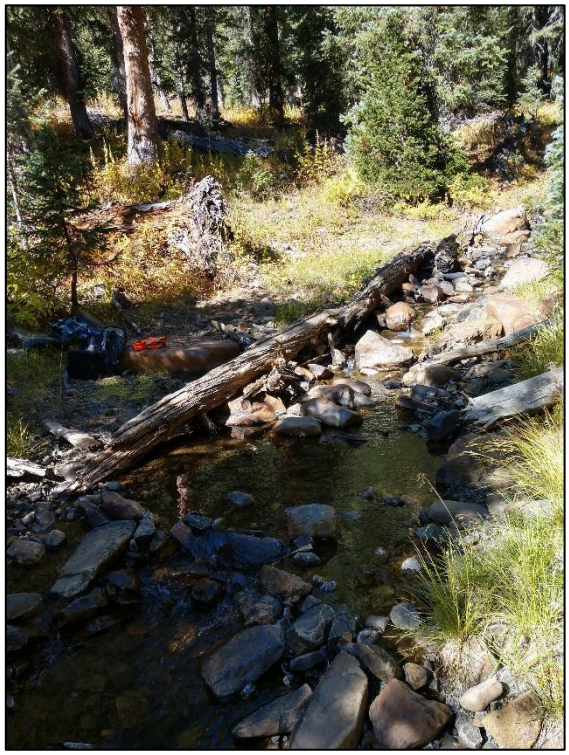


Photo 3. Elk Creek near cross-section looking upstream.

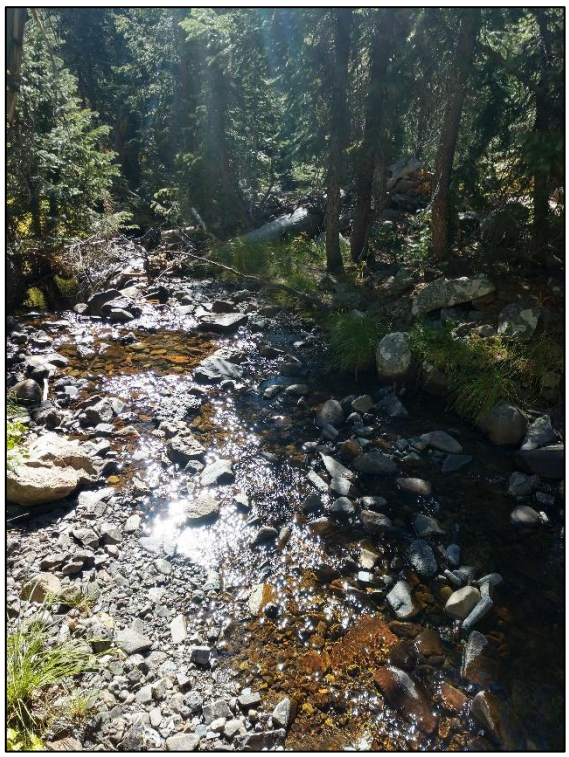

Photo 4. Elk Creek near cross-section looking downstream. The woody debris, near the top of the photo, created a medium-sized pool in the creek.

Photo 5. Elk Creek cross-section view from the river-left bank.

Relationship to Existing State Policy

HCCA is proposing this instream flow to the CWCB in furtherance of the State of Colorado's policy "that the wildlife and their environment are to be protected, preserved, enhanced, and managed for the use, benefit, and enjoyment of the people of this state and its visitors… and that, to carry out such program and policy, there shall be a continuous operation of planning, acquisition, and development of wildlife habitats and facilities for wildlife-related opportunities." C.R.S. 33-1-101(1).

Comments

BRK 421 g TTL
NO FISH SAMPLING, WATER QUALITY ONLY.
BP EFISH, For contaminants of potential concern by U.S. EPA as part of Standard Mine cleanup assessment.
BP EFISH, no fish seen or taken additional half mile surveyed visually and no fish seen
BP EFISH, no fish seen or taken
NULL
UTM"S in NAD83; No fish sampled or seen
Backpack Electrofishing, no fish seen or taken.
From culvert on CR12 upstream. Original lengths were fork lengths and were adjusted to estimate total length of fish to report here.
Just above CO RD 12
Backpack Electrofishing, no fish seen or taken.
Sampled at CR 12
No fish seen or netted.

****Please be sure to measure at least 100 pebbles (10 in 10 transects or 5 in 20 transects- depending on stream size, for accurate distributional representation.****

EMBEDDEDNESS:

If intermediate particle axis is less than 32 mm chose the nearest cobble for embeddedness.
If no cobble >32 mm is present without taking a step, record 100% embedded.

	Random pebble for **Percent Embeddedness** (one per transect)									
5	7	10	9	3	8	5	2	1	7	#
										D(e)/ D(t)

D(e) = embedded depth; D(t) = total depth

Basin Characteristics

Parameter Code	Parameter Description	Value	Unit
DRNAREA	Area that drains to a point on a stream	1.68	square
BSLDEM10M	Mean basin slope computed from 10 m DEM	36	percent
PRECIP	Mean Annual Precipitation	33.75	inches
ELEV	Mean Basin Elevation	10955	feet
CSL1085LFP	Change in elevation divided by length between points 10 and 85 percent of distance along the longest flow path to the basin divide, LFP from 2D grid	703.1	feet pe
EL7500	Percent of area above 7500 ft	100	percent

Parameter Code	Parameter Description	Value	Unit
ELEVMAX	Maximum basin elevation	12300	feet
I24H100Y	Maximum 24-hour precipitation that occurs on average once in 100 years	3.71	inches
I24H2Y	Maximum 24-hour precipitation that occurs on average once in 2 years - Equivalent to precipitation intensity index	1.77	inches
I6H100Y	6-hour precipitation that is expected to occur on average once in 100 years	1.89	inches
I6H2Y	Maximum 6-hour precipitation that occurs on average once in 2 years	0.97	inches
LAT_OUT	Latitude of Basin Outlet	38.856021	degrees
LC11BARE	Percentage of barren from NLCD 2011 class 31	2.9	percent
LC11CRPHAY	Percentage of cultivated crops and hay, classes 81 and 82, from NLCD 2011	0	percent
LC11DEV	Percentage of developed (urban) land from NLCD 2011 classes 21-24	0.1	percent
LC11FOREST	Percentage of forest from NLCD 2011 classes 41-43	56.7	percent
LC11GRASS	Percent of area covered by grassland/herbaceous using 2011 NLCD	35.8	percent
LC11IMP	Average percentage of impervious area determined from NLCD 2011 impervious dataset	4.1	percent
LC11SHRUB	Percent of area covered by shrubland using 2011 NLCD	0	percent
LC11SNOIC	Percent snow and ice from NLCD 2011 class 12	0	percent
LC11WATER	Percent of open water, class 11, from NLCD 2011	0.6	percent
LC11WETLND	Percentage of wetlands, classes 90 and 95, from NLCD 2011	3.9	percent
LFPLENGTH	Length of longest flow path	3.21	miles
LONG_OUT	Longitude of Basin Outlet	-107.059617	degrees
MINBELEV	Minimum basin elevation	9540	feet
OUTLETELEV	Elevation of the stream outlet in thousands of feet above NAVD88.	9544	feet
RCN	Runoff-curve number as defined by NRCS (http://policy.nrcs.usda.gov/OpenNonWebContent.aspx?content=17758.wba)	47.5	dimens

Parameter Code	Parameter Description	Value	Unit
RUNCO_CO	Soil runoff coefficient as defined by Verdin and Gross (2017)	0.38	dimens
SSURGOA	Percentage of area of Hydrologic Soil Type A from SSURGO	42.7	percent
SSURGOB	Percentage of area of Hydrologic Soil Type B from SSURGO	45.3	percent
SSURGOC	Percentage of area of Hydrologic Soil Type C from SSURGO	0	percent
SSURGOD	Percentage of area of Hydrologic Soil Type D from SSURGO	6.54	percent
STATSCLAY	Percentage of clay soils from STATSGO	24.02	percent
STORNHD	Percent storage (wetlands and waterbodies) determined from 1:24K NHD	0.7	percent
TOC	Time of concentration in hours	2.02	hours

Peak-Flow Statistics Parameters[Mountain Region Peak Flow]

Parameter Code	Parameter Name	Value	Units	Min Limit	Max Limit
DRNAREA	Drainage Area	1.68	square miles	1	1060
BSLDEM10M	Mean Basin Slope from 10m DEM	36	percent	7.6	60.2
PRECIP	Mean Annual Precipitation	33.75	inches	18	47

Peak-Flow Statistics Flow Report[Mountain Region Peak Flow]

PII: Prediction Interval-Lower, PIu: Prediction Interval-Upper, SEp: Standard Error of Prediction, SE: Standard Error (other -- see report)

Statistic	Value	Unit	SEp
2 Year Peak Flood	39.8	ft^3/s	49
5 Year Peak Flood	54.9	ft^3/s	44
10 Year Peak Flood	63.8	ft^3/s	41
25 Year Peak Flood	77.1	ft^3/s	40

Statistic	Value	Unit	SEp
50 Year Peak Flood	89.9	ft^3/s	39
100 Year Peak Flood	97.7	ft^3/s	36
200 Year Peak Flood	104	ft^3/s	36
500 Year Peak Flood	121	ft^3/s	33
