# Contents

# Executive Summary

## Summary

The H2infO Water Provider Information Tool Phase 2 project expanded the initial pilot tool from seven test counties along the southern Front Range by adding the remaining water providers in the Metro Basin roundtable counties of Elbert, Jefferson, and Broomfield and the South Platte roundtable counties of Boulder, Larimer and Weld.  The Phase 2 project also included significant improvements to the user interface and mobile accessibility based on input received during the initial pilot program.

The Phase 2 tool, with additional data and improved user interface, is currently deployed to the https://h2info-co.com url and is being introduced to the added counties or re-introduced to users in the original pilot counties.

|  | Counties | # of Providers |
|---|---|---|
| **Pilot Project – 2019/2020** | Pueblo, Teller, El Paso, Douglas, Arapahoe, Denver, Adams | 271 |
| **Phase 2 - 2021** | Elbert, Jefferson, Broomfield, Boulder, Larimer, Weld | 101* |
| **Total** | 13 Counties | 372* |

*Additional municipalities still being added as data service areas evolve

This expansion effectively doubles the potential home buyer interactions, based on population, with 120,000 annual transactions along these Front Range counties.  The real estate community is incentivized to use the tool to inform and serve all types of clients. Water suppliers benefit from consumer understanding of supplier details.  Home buyer participation in water understanding and engagement provides a foundational component needed to meet the CWP stretch goals.

The tool remains a free, online, public data aggregation and disclosure tool linking water supplier information with property buyers and realtors to increase buyer awareness of address specific conservation plans, water planning, and municipal water suppliers local objectives. The public's use of the tool directly supports the conservation ethic recognizing the need to work within our arid environment, increases specific understanding of conservation practices, and reduces wasteful behavior. The target audience for the tool's data are the homebuyers that make up the growing population and demographic trends described in the Colorado Water Plan.

Phase 2 activities began on July 30, 2020 and the improved tool deployed to the website in March 2021 after receipt of Colorado Water Plan grant approval in May 2020

## Acknowledgments

Peak Spatial wishes to thank and acknowledge the support received from the following individuals through this project.  Their willingness to try new and innovative approaches to improving public, consumer water knowledge led the start of this project and it's continuation for the foreseeable future.

These influencers and all those users and water providers who have contributed their ideas and corrections have been critical to the success and future of this public outreach tool.

- Kevin Reidy, CWCB program lead
- Donnie Dustin, Fort Collins Water
- Sean Chambers, Greeley Water
- Barbara Koelzer, Regional Government Affairs Director for Realtor Associations in Larimer, Weld, Boulder and Broomfield Counties
- Mark Bishop, Affinity Realtors Fort Collins
- Kim Soullier, City of Golden GIS
- Sean Cronin, Saint Vrain and Left Hand Water Conservancy District

# Project Background

## Purpose

The purpose and overall objective of the H2infO Water Provider Tool Program, both in the original Pilot area and in this Phase 2 grant implementation, is to build and operate a "public facing" site that connects Coloradoans with their water providers when they are making home buying decisions.  The rationale for the tool is based on the complex water provider boundaries, characteristics, and capabilities that range widely from provider to provider and that typically don't correspond with county or city boundaries.

The tool also supports water providers who often, at the billing and administrative level, need to help their customers and the general public to understand who provides them with water service. It also supports realtors who are providing necessary information to a home buyer prior to a sale.  Once a home buyer makes a choice they are effectively choosing a water provider.

The program supports the conservation, public education and outreach planks of the Colorado Water Plan (CWP) and reaches beyond the Colorado water community to the citizens of the Colorado.  With the population of Colorado projected to grow by an additional 2.5 - 5 million people, over the time period of the CWP, this particular tool targets that future, largely municipal demand, on the limited water supplies within the State.

## Vision

The long term vision remains to expand the tool to other areas in the State and to provide a consistent resource that realtors, home buyers, and water providers can rely on to identify the basic characteristics of water providers servicing particular properties.

Placing water information in the hands of home buyers prior to making a home purchase decision develops a more water savvy population, highlights water provider data specific to potential home properties and reduces the potential for customer confusion relative to their water providers.

## Project Tasks

Tasks for the Phase 2 effort are listed below and have been or are being, implemented during the grant effort.  CWCB funding supports the initial three tasks only and Tasks 4 through 6 are contributed as grantee funded and executed tasks.  The tasks that make up the grant effort are:

- Task 1 – Geographic Expansion
- Task 2 – Refine/Update Water Provider Attributes
- Task 3 – User Interface Modifications
- Task 4 – Track Metrics
- Task 5 – Extend Outreach and Advertising
- Task 6 – Operations and Maintenance

The first three tasks are completed and will continue to be updated even after that phase of the work is completed.  Updates to the tools baseline information will continue due to the transitory nature of the public data controlled primarily by water providers through their public presence and the annual updates for rates/fees and other plans that change during the life of the water districts/providers operations.  Tasks 4-6 are now in progress and also continue to take place after the grant funded

activities are complete.  The Water Provider Tool operations will continue with updates as input or corrections to water provider dictate during the remainder of the 2021 calendar year.

# Tool Implementation

## Geographic Expansion – Phase 2/Task 1

The Phase 2 expansion of the pilot program added Elbert, Jefferson, Broomfield, Boulder, Larimer and Weld County water providers to the tool.  These additions now accommodate the majority of the complex water service area jurisdictional challenges within the state of Colorado.  They were specifically added to the tool to support the urban corridor realtors and home buyers that make up the bulk of residential home sales in the State serviced by a water provider.  In particular, the addition of the counties around the Denver metropolitan area provide comprehensive coverage (and the Metro Basin round table) of that urban area. Growing the tool to accommodate northern Front Range counties expands the utility of the tool to those rapidly growing areas such as Longmont, Loveland, Windsor, Greeley and Fort Collins.  These counties added over 100 additional providers to the tool, a greater than 25% increase in the total providers.  With the addition of these counties the tool includes 372 current providers.

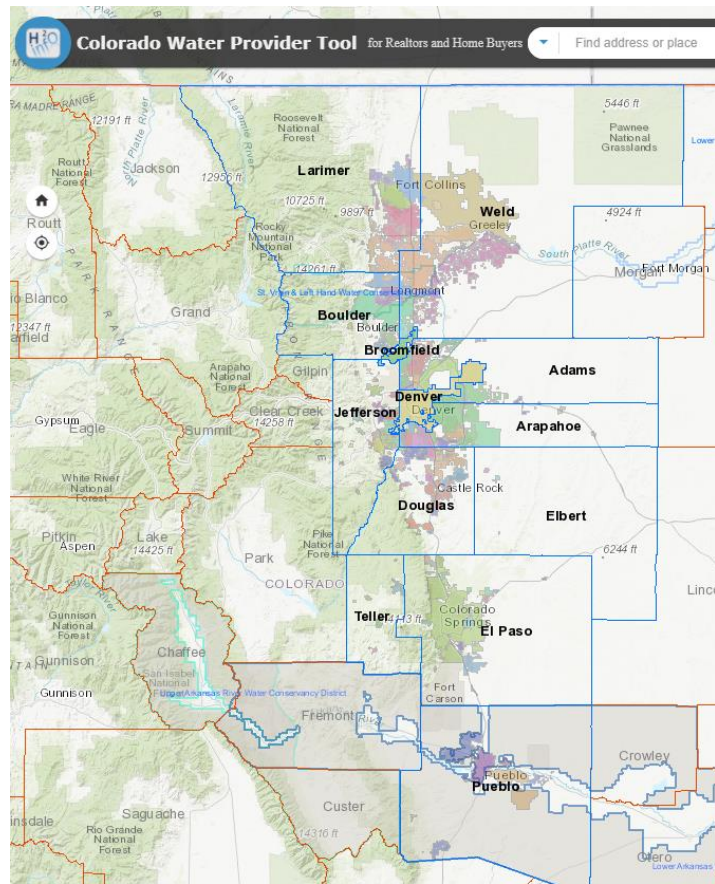

Figure 2- Phase 2 Counties (blue bordered)

The thematic nature of the new water providers is slightly different from the original pilot program data set.  While the primary challenge of water service areas not aligning with government jurisdictions remains the same, the northern Front Range providers include large,  geographically extended service areas that provide water to municipalities within their boundaries.  The municipalities, in most cases, are the point of contact for home owners relative to water utility business, though the source of water comes from the larger water provider.  These differences resulted in water provider database attributes being a combination of municipality business contact and water provider water quality information.

Each of the water providers in the tool, whether a municipal utilities, water or metropolitan districts, are required to have a public water system identification (PWSID) number.  Some of the larger water districts that serviced more than 2000 acre feet of water were also identified as HB-1051 providers. These providers are required, by that numbered state legislation, to report additional information to the

State water conservation board.  A listing of the water providers included in the tool is provided in Appendix A of this document.

## Refine/Update Water Provider Attributes – Phase 2/Task 2

In addition to collecting all the water provider attributes for the new water providers Task 2 examined the baseline data collected for the pilot project water providers and looked at the possible additions of other related water data that might be helpful for realtors and home buyers.  This work included looking at adding available drought data sets for the region, active wildfire events and perimeters withing the region, and other water layers.  In particular the team also looked at, and now includes in the tool, water conservation districts within the region.

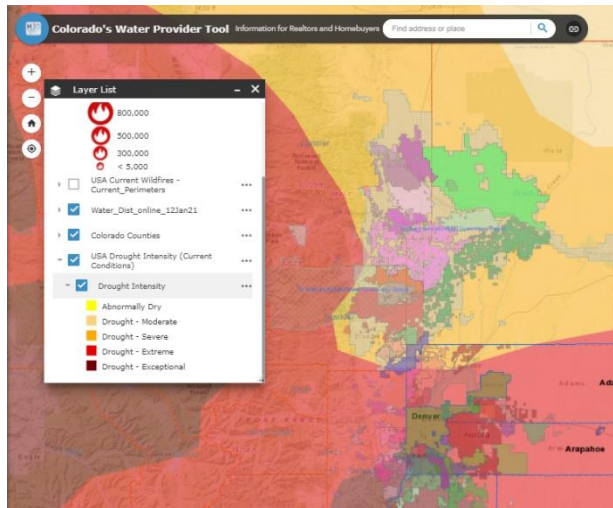

The fire data sets remain in the new Phase 2 tool.  The drought data is a "by subscription" type data set that requires special permissions that ended up being outside the bounds of the tool objective of being publicly accessible.  That may change over time and the data set is a solid informational layer for interested homeowners.

## User Interface Modifications – Phase 2/Task 3

Task 3 of the grant work focused on the tool interface and built on experiences gained in the initial Pilot and comments and input from water providers and users.  The Pilot implementation focused on a simple web interface and, while some effort went into making the sight more responsive for mobile/smart phone users, that effort didn't produce as robust a tool as users would have liked.

The team adopted a responsive site approach from the outset and implemented the tool using ESRI's ArcGIS Web AppBuilder (WAB).  By using WAB the team could take advantage of a number of useful development tools, widgets and data access capabilities that produced a simpler but more attractive interface.  This approach also provides flexibility to rapidly change map contents and functionality while offering a range of deployment options from in house servers to cloud implementations.

The tool remains a free web accessible map based interface to the water provider information contained in a curated database that now includes the thirteen of the States most populated/urban county's water providers and the water provider's attributes.

All of the baseline functions of the tool were carried forward into the Phase 2 product with more attractive and simpler accessibility. Searches in the tool continue to support specific home addresses and searches for water provider names for those users who are interested in getting to a specific water provider service area rather than a home address was also added. Searches continue to support device location, address data entry, the previously mentioned water provider name search, and simple map/point and click options that can be used to focus in on particular homes/properties and initiate a water provider query. An address query in the Phase 2 system now returns the basic four hyperlinked data elements (Water Provider website, rates/fees, conservation plan, and water quality/consumer confidence) for a water provider in one simple query.

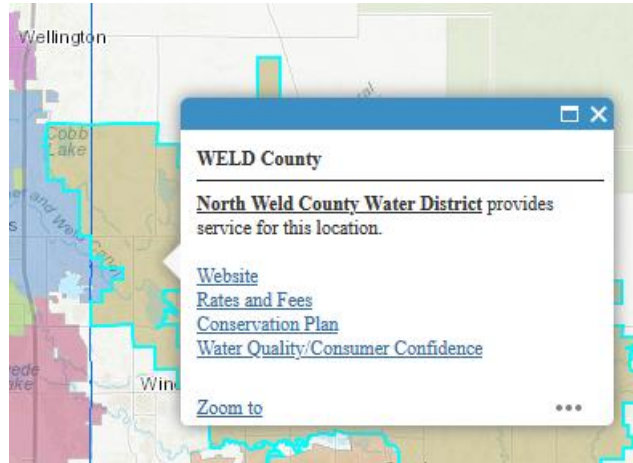

## Tool Components

### *User Interface*

The team designed the Water Provider Tool interface around a map interface that includes embedded widgets for zooming, address/water provider searching, basemap toggling (between imagery and map data and "point and click" querying of the map/districts. Removing the "Locate Residence" and "Get Report" buttons from the pilot interface was the main modification to simplify the retrieval of water

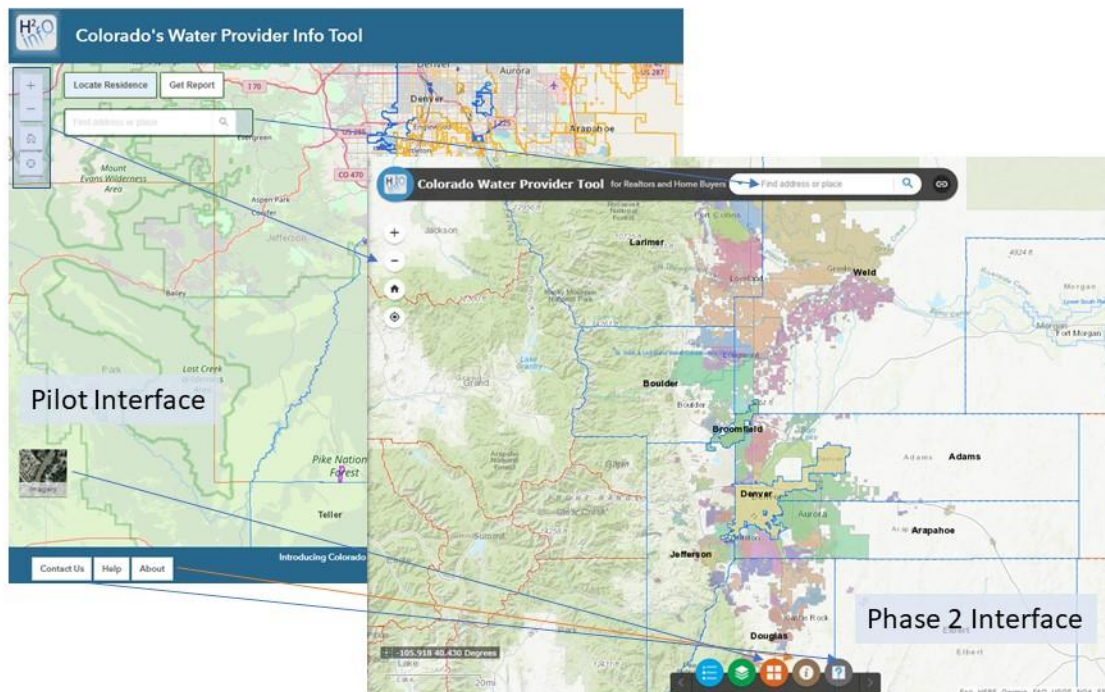

*Figure 3 - Pilot to Phase 2 Interface Mods*

provider information.  Customizing the map info point-and-click retrieval to return the basic report in one step answers complaints and input received during the pilot to make the system simpler. Figure 3 shows the Pilot interface and the new Phase 2 interface.  One of the primary values of the user interface modifications was the simplification of the display and user choices and visibility of water district service areas as can be seen in the figure above.

The team eliminated the header and footer banners in the Phase 2 interface as well as the query buttons allowing for a more responsive/smart phone friendly interface.  A preview of the newer interface in a notional Samsung 8 type display is shown in Figure 4.

## Widgets and Tools

The Phase 2 user interface moved Pilot program footer elements of Help, Contact, and About to accessible widget icons.  The Help instructions were modified to accommodate the changes made to the basic user interface and the previous Contact verbiage in now included in the About paragraphs.  These activities were all done to simplify the interface.

A sponsor/supporter splash page opens up showing the tool's supporting agencies prior to a user getting to the tool itself.  The splash page also includes a data disclaimer that describes the purpose of the tool, the source of data and cautions against inappropriate use or inferences made based on the tool's information.

*Figure 4 - Notional Samsung Phone Display*

### Tools

User tools are located in the upper right corner of the map and include standard zoom buttons, a home button, a device button, a "Locate Residence" and "Get Report" button, and an address search entry window.

### Search

#### Address and Water Provider

The tool uses ESRI's ArcGIS World Geocoding Service to refine a user's location based on free text searching for the address.  While a user is typing in the address or water provider name in the search window, the service begins to refine the search and presents address and water provider options for the user to select.  This service is similar to the Google address search often found on web site implementations.

#### Device/User Location

The device search is the target icon on the map that turns on "use of device location" so that that map will zoom to the location of the smart phone, tablet or wifi service connecting a desktop system to the web.  This feature will be particularly useful to users who are mobile, like realtors and home buyers, so that they can dynamically query the tool while looking at homes.

*Figure 5- Tools/Widgets*

### Home Extent

The home button on the map simply returns the tool to its default extent, map center, and zoom level so that a user can back out of detailed searches and start from a fresh page. The Phase 2 system operates as the Pilot system with the home center at a point further north in the Front Range to accommodate the geographic expansion of the tool.

### Legend

The legend simply displays the icons and colors associated with the map graphics in the display

### Layer List

The layer list shows all the layers in the map and allows a user to turn on/off layers of particular interest to them.

### Map Gallery

The map gallery offers the user the ability to change the background map display from Open Street Map, Terrain w/Labels, Topographic, or Imagery w/Labels. The default site is set to the Open Street Map display.

### About

The About tool/widget provides basic information about the tool and also provides a "contact us" link so that users and water providers can connect with the team to report changes or recommendations.

### Help

The help tool provides simple instructions on how to use the basic tool. The focus of this help tool is on the users who want to search for water providers so the information provides the basic methods of identifying that information.

### Attribute Table

The attribute table widget used in the Phase 2 user interface is completely new and it takes the place of the Full Report function implemented in the Pilot. The point of the Full Report function was to give the full list of water provider attributes to users who had additional interests beyond the basic four hyperlinked reports. The widget opens a table in the application/site that shows all of the water provider attributes in the system and additionally provides the user the ability to sort, filter and download the information to a csv file (comma separated value) for use in any spreadsheet or database program.

The attribute table is connected to the map display so it can be used to return the entire water provider data tables if the full tool extent (all 13 counties) is shown on the map.

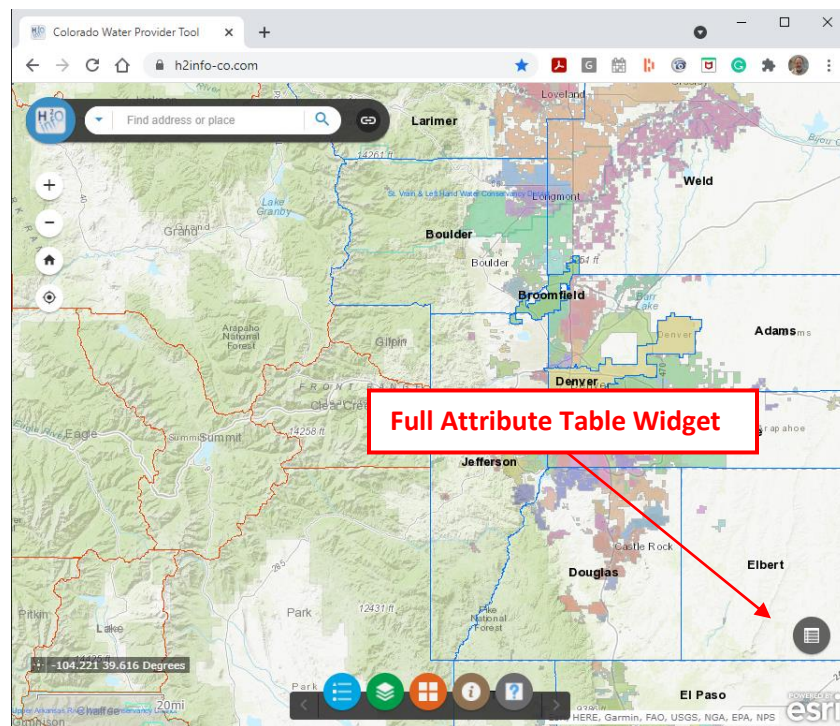

When a user selects the Attribute Table widget the table shown below opens showing all attributes of the water provider. To export the data, a user needs to select the "Options" choice in the top banner and then the "Export all to CSV" as shown in the figure below.

### Water Provider Database

#### *Sources*

Data collected in the water provider database comes primarily from three public but disparate sources: the Colorado Department of Local Affairs (DOLA), county assessors, and the water providers themselves. Secondary sources include regional water organizations, such as the Pikes Peak Regional Water Authority and the South Metro Water Supply Authority, and the State's HB-1051 database that is publicly accessible at http://cowaterefficiency.com.  Access to this site requires setting up an account but it is open to users desiring more details about those water providers who report HB-1051 data.

The most significant mapping variable in the system is the water provider service area boundary.  This, by and large, came from the water provider inputs to the DOLA system which shows water district/utility boundaries and other district boundaries of interest such as metropolitan districts which often have a PWSID number.

Nearly all water provider specific information such as annual rates/fees, conservation plans, water quality reports and contact information comes from the water districts themselves.  Some secondary water distribution districts include this information from their primary water provider so, in some cases a water district may have its own rates/fees but references Denver Water's water quality and conservation plans as their own.

*Content Description*

The attributes collected and curated for the water providers in the pilot program are shown with a brief description, in the table below.

*Table 1 – Water Provider Database Attributes*

| Attribute | Description | Typical Source |
|---|---|---|
| Boundary | Water Provider Physical Boundary | DOLA/County Assessors |
| County | Political boundary | DOLA/County Assessors |
| Population | Census | DOLA |
| Water Source | Ground Water/Purchase Surface Water/Surface Water | DOLA |
| Contact Information | Address | DOLA/Water Providers |
| HB 1051 Reporting (Y/N) | Water Provider Participation | HB-1051 Site |
| HP-1051 Gallons/Capita/Day | Self explanatory | HB-1051 Site |
| HP-1051 Non-Revenue System Loss/Yr | Self explanatory | HB-1051 Site |
| Municipality or County | Political boundary | DOLA/County Assessors |
| Water Loss Audits (Y/N) | Performed and published? | Water Provider Sites |
| Sanitation and Wastewater Provider? (Y/N) | Self explanatory | Water Provider Sites |
| Regional Water Authority Group Member (Y/N) and URL | Self explanatory | Regional Water Group Sites |
| Regular Board Meetings | Self-explanatory | Water Provider Sites |
| Conservation Irrigation Use Restrictions | Self-explanatory | Water Provider Sites |
| Public Water System ID Number | Self-explanatory | DOLA/CDPHE Data |
| Web Page URL | Link to main water provider site | Water Provider and DOLA |
| Conservation Plan URL | Link to water provider conservation plan if available | Water Provider |
| Consumer Confidence Report | Link to water provider water quality and/or consumer confidence report if available | Water Provider |
| Rates and Fees | Link to water provider rates and fees sites for current year or all published years | Water Provider |
| Integration with Land Use Plan | Link to land use plan if available | Water Provider |
| Governmental Type | Special District, Community, Municipality, etc | Water Provider/DOLA |
| Public Water System Provider Name | Official Name of Water provider | DOLA/CDPHE |
| Participation in Integrated Land Use and Water Supply/(Y/N) | Is there a published relationship between water providers and land use entities? | Water Provider |
| Source | Notes on the source of the data elements | Various |

### Output

The Phase 2 tool eliminated the idea of "report generation" in favor of displaying basic information online for immediate user understanding and application and providing viewing, sorting, filtering and downloading all  tabular attribute information for any water provider in the Phase 2 area.

System data can be printed by downloading the attributes from the attribute table or by taking a screen shot of the data.  This approach was taken in Phase 2 to simplify the general system use while maintaining the ability to extract more detailed information from the tool.

## Final Thoughts

### Outreach

Outreach will continue to focus on regional water authorities and basin Roundtable presentations.  The team provided updates on the Phase 2 tool to the Pikes Peak Regional Water Authority and the South Metro Water Supply Authority and will be sending out updates to the Arkansas and Metro Roundtables through the Summer of 2021.  The team continues to make regularly appearances at and announcements to the members of these groups.

One simple approach taken by the team was to prepare and print business cards with the tool's URL and the team's contact information, for distribution to water providers so that they can engage their billing and administrative/customer teams to bookmark the tool and use it to help answer calls for support that might come from customers who are actually outside their service area.  This particular issue has been highlighted by a number of water providers as a direct benefit to them since it offers the possibility of reducing or shortening time spent directing water users to the correct water provider.

*Figure 6 - Business Card*

The team also hopes to work with County assessors whose counties are included in the system.  The addition of the northern counties now offers the opportunity to provide a more comprehensive and useful service to these new assessors.

Finally, the outreach will focus on State and Regional Realtor organizations such as the Pikes Peak Association of Realtors and their Colorado State multiple lising service (MLS) counterparts.

### Tool Expansion

The Phase 2 tool deployment represents the first operational deployment of the tool and the region covered by this Phase incorporates the primary urban range of water provider complexities in Colorado. Even though that's the case, there are a number of possible expansion directions for the tool.

We've discussed with realtors the possibility of adding links to well and water rights types of public information sites as well as connecting in a more analytical way for real estate and land development types of customers who want to dig deeper into water issues at particular locations

Another area of tool expansion could be to create a more comprehensive water provider information tool for government users at the State and Local levels.  Creating the dataset and user interface for this tool revealed many holes in the State data sets that aren't filled by any particular organization.  DOLA sourced a number of the attributes in the tool's dataset but they don't keep track of changing service area boundaries.  Looking to non-governmental organizations such as the Special District's Association also leads to datasets that don't always keep up with the full breadth of water providers in Colorado.

These areas offer opportunities to expand the tool or extend a different version of the tool, using the underlying data sets, for specific interest groups.

### Tool Analytics

The team implemented a basic Google Analytics component in the Phase 2 deployment of the tool beginning in May 2021 and will track site visit details associated with visitors including the type of device accessing the tool, browser type, return vs new users, times of visits, time on the site, and referral or non-referral visitors.

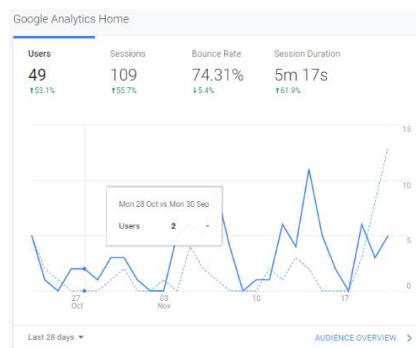

We will be tracking trends and interactions with the tool over the course of the coming months to determine whether there are changes required in how we are making the tool available and known to the using public.

Two specific metric of interest for the team are return vs new visitors and session duration.  Return visitors are those who consistently use the tool, we assume, as part of their day to day activities.  This class of users would include water provider and realtors.

# Conclusions

The development, deployment and operations of the Phase 2 tool has added more universal access and value to the information in the water provider database. Expanding the tool to include all of the Denver metropolitan area as well as the growing northern Front Range urban centers of Fort Collins, Loveland, Windsor, Greeley and Longmont will accommodate a number of rapidly growing residential developments.

The team plans to operate and update the tool for the indefinite future using sponsorships from water providers and realtors. There are certainly opportunities to add other Colorado counties or targeted municipalities with growing water and metropolitan districts.

User interface modifications will be kept to a minimum for the foreseeable future as users become accustomed to the site. More changes could be made but will be made only after assessing potential impact to the user experience. The team made solid progress toward making the mobile site more friendly for users and in simplifying the tool by removing unnecessary steps to acquiring information.

Quality of water provider attributes will always be an on-going challenge that will be addressed as the tool evolves and as input is received. Service area boundaries are the largest challenge due to the shifting jurisdictions associated with these features. Annual updates in data have been accomplished over the past two years and those modifications (Rates/Fees, Conservation Plans, Water Quality) are relatively straightforward to update. Boundaries require more man power and care to make sure that critical information is correct. One approach that the team plans to take with these boundaries is to establish technical and data sharing connections with the larger water providers in counties so that the boundaries between those providers and others can be more automatically checked.

Water Provider Relationships – the complex agreements between large and small water providers that we noted during the Pilot program, especially with Denver Water, played out in the Phase 2 geographic expansion as well with many small municipalities operating/managing customer interactions though their water was provided by a larger water district. The example in the northern Front Range that showed this situation were the small municipalities of Eaton, Ault and Pierce all of which managed customer water issues though their water was provided by the large North Weld Water District. There are likely other such arrangements that the team will need to be mindful of as we edit attributes for tool users.

Appendix A – Water Providers in the Phase 2 System (includes original Pilot providers)
