PASTORIUS HEADGATE REPLACEMENT PROJECT UPDATE

The headgate replacement has been rescheduled to happen at the end of the water season due to a couple of factors. One the level of the water in the reservoir would require a large coffer dam that doesn't necessarily ensure the dry work environment required for the installation of the framing of the headgate. Two, drawing the lake down would waste water in a year we are not expecting great runoff due to an extremely dry fall. It allows us to install after the water season when we can draw the lake down and not have to construct such a large coffer dam.

The headgate has been built and is ready for installation.

Contractor has done a walk through to remove the existing radial gate and remove fencing to access the area.
