

EXHIBIT G

Water Information

This operation will not directly affect surface or ground water systems. The only known tributary water course near the affected land is East Rifle Creek which is adjacent to and east of Highway 325.

The only other water near the mining area is an intermittent stream which flows only in the spring and early summer at a very minimal rate. This intermittent stream will not be affected by the mining activity.

There are no known tributary water courses, wells, springs, stock-water, ponds, reservoirs, ditches or aquifers on the land affected by the mining activity.

summer
thunderstorms
can produce
