

**NEW ELK MINE**  
**Permit No. C-1981-012**

**QUARTERLY COAL WASTE BANK INSPECTION REPORT**  
**December 28, 2017**

The three coal waste banks at the New Elk Mine were inspected on December 28, 2017. The weather was sunny but cold. Ground conditions were generally dry but with little precipitation. Received during the fourth quarter. Vegetation is well established with the north facing slope of DWA#1 exhibiting the best vegetation. The south facing reclaimed benches of the RDA also exhibit good vegetative growth with some shrubs established on the earliest reclamation areas (1989-1995).

Sediment Control Pond #4 is situated west of DWDA#1. This pond has never discharged and but held some water pumped from pond 8 via pond 6. DWPA#2 run-off reports to Pond#7 via a series of ditches and culverts. Run-off from the RDA reports to Pond 8 located at the base of the waste bank just north of Highway 12.

## **DEVELOPMENT WASTE DISPOSAL AREA No. 1**

### **GENERAL DESCRIPTION OR REFERENCE TO SITE PLAN:**

This Development Waste Disposal Area is located south of State Highway 12 and west of the main facility Access Road. It is adjacent to and north of the Middle Fork of the Purgatoire River. The area is permitted for disposal of waste rock from underground mining and disposal of sediment collected from ponds and ditches located within the mine permit area. Since mine closure in 1989, the area has been used for disposal of sediment removed from ponds and ditches located within the mine permit area. In 2004 the area was closed and reclaimed. The area received Phase I bond release in 2005 and is eligible for an application for final bond release pending required vegetation assessments.

### **ACTIVITY DURING INSPECTION:**

- ☐ Removal of Topsoil and Organic Matter
- ☐ Placement of Under-drains
- ☐ Installation of Surface Drainage System
- ☐ Construction of Fill
- ☐ Placement of Topsoil
- ☐ Seeding
- ☒ Other Facility in Final Reclamation- Phase I Bond Released

**Drainage:** (Discussion of springs, seeps, overland and channel flow, underdrain construction and/or discharge, integrity of 100-year 24-hour drainage structures, and evidence of positive drainage).

Positive drainage is maintained on the surface of the DWDA. No evidence of neither springs nor seeps was observed.

**Observation of Fill Construction:** (Description of material, compaction, lift thicknesses, slopes, and construction methods)

Fill construction and reclamation of the surface has been completed. The site was seeded in 2005 and is eligible for both Phase II & III reclamation bond release subject to a successful vegetation assessment.

**Indications of Potential Failure or Instability:**

Surface and out slopes of the pile were inspected for visible signs of potential failure or instability. None were observed

**Threat to Human Life or Property:**

Failure could impact persons or equipment on or adjacent to the disposal area. No threat was observed and with final reclamation is unlikely to occur. .

**Potential Harm to Land, Air, and Water Resources:**

Failure could impact the Purgatoire River or areas adjacent to the disposal area. No adverse conditions were observed.

**DOCUMENTATION AND OTHER OBSERVATIONS**

Early winter conditions prevail with limited soil moisture and soil lightly frozen. Site exhibits good vegetation density. Overall the site is in good condition. Photos on file.

**Maintenance Required:**

None at this time.

## DEVELOPMENT WASTE DISPOSAL AREA No. 2

### GENERAL DESCRIPTION OR REFERENCE TO SITE PLAN:

This Development Waste Disposal Area is located south of State Highway 12 and east of the main facility Access Road. It is adjacent to and north of the Middle Fork of the Purgatoire River. The area is permitted for disposal of waste rock from underground mining and disposal of sediment collected from ponds and ditches located within the mine permit area

### ACTIVITY DURING INSPECTION:

- ☐ Removal of Topsoil and Organic Matter
- ☐ Placement of Under-drains
- ☐ Installation of Surface Drainage System
- ☐ Construction of Fill
- ☐ Placement of Topsoil
- ☐ Seeding
- ☒ Other Facility was idle at the time of inspection

Refuse placement has been completed and the operator has trucked excess waste to the RDA so that finished slopes can be brought to approved grade. The excess storage space on the west end of the pile is used as a sediment drying area. Dried waste has been trucked to the RDA for permanent disposal.

**Drainage:** (Discussion of springs, seeps, overland and channel flow, underdrain construction and/or discharge, integrity of 100-year 24-hour drainage structures, and evidence of positive drainage).

Positive drainage is maintained on the surface of the DWDA. No evidence of springs nor seeps was observed.

**Observation of Fill Construction:** (Description of material, compaction, lift thicknesses, slopes, and construction methods)

Coarse to fine-grained development waste rock has been placed and compacted according to approved plans. Compaction testing was done by CTL-Thompson on May 28, 2012 demonstrating that refuse placement has been conducted in accordance with plan requirements.

No refuse placement has occurred since the May 2012 compaction testing.

**Indications of Potential Failure or Instability:**

Surface and out slopes of the pile were inspected for visible signs of potential failure or instability. None were observed

**Threat to Human Life or Property:**

Failure could impact persons or equipment on or adjacent to the disposal area.  
No threat was observed. .

**Potential Harm to Land, Air, and Water Resources:**

Failure could impact the Purgatoire River or areas adjacent to the disposal area.  
No adverse conditions were observed.

**DOCUMENTATION AND OTHER OBSERVATIONS**

Early winter conditions prevail with the surface dry.. Overall the site is in good condition.

**Maintenance Required:**

As noted previously, rills continue developing primarily on the south facing slope and may require regrading if development continues. The area is at storage capacity. Operator is evaluating reclaiming the area vs. permitting alternative uses for the land north of the Purgatoire River and south of Highway 12.

## **REFUSE DISPOSAL AREA (RDA)**

**GENERAL DESCRIPTION OR REFERENCE TO SITE PLAN:**

The Primary Refuse Disposal Area is located north of State Highway 12 and the Middle Fork of the Purgatoire River. Refuse is transported by conveyor belt to the RDA from the coal preparation plant located south of the river. The plant operated intermittently during 2012 with temporary cessation of operations announced effective July 11, 2012. The mine briefly returned to production May-September, 2014; but returned to temporary cessation of mining in September 2014. Since then the mine has intermittently transported development waste from temporary storage piles to the RDA

**ACTIVITY DURING INSPECTION:**

The depth to water in water level monitoring wells was measured November 16, 2017:

Well	Depth	Elevation
TH-1	42.2 ft	7443.10
TH-2	69.6 ft	7461.24
TH-3	93.3 ft	7500.97

Photos taken during the inspection are stored on file.

**Maintenance Required**

None required at this time.
