Tim,

The extent of the visible damage to the liner in the area under investigation has been delineated. With the approval of TR100, liner replacement activities have begun. Damaged liner was removed from the southern section of the investigation area between the 9650' and 9750' benches. The anchor trench along the 9750' was excavated using a CAT312C. Additionally, a grid of Soil Liner Fill (SLF) sample locations was laid out between the 9650' and 9750' benches. These sample locations were checked for SLF depth. All locations recorded >12" of clay depth.

Several photos are attached documenting the repair activities. Please let me know if you have any questions.

Thank you,

**Justin Bills**
