

WALLACE PIT LOCATED TO NORTH AND EAST

AREAS AS LABELED ABOVE:

- A - B - C - D Areas to be mined in future: not disturbed as of October 2020.
- D While additional land is NOT expected to be disturbed in 2020-21, if additional area is needed, will be in Area D and Buffer Zone near it.
- W WAPA Power Pylon with required setback (unaffected).
- S Primary soil stockpile as currently configured. There are other, small, transient stockpiles of overburden and soil in the current mining area.
- BF (Buffer Zone) As shown is not affected, but some parts may be in future as part of reclamation.
- Currently Mining (19 acres) - including active mining and highwalls, plant locations, materials, soil and overburden stockpiles, and access roads. There are also some internal storm water basins. Includes large stockpile S in total area. Much of the area is at/near final grade but not clearly identified.
- At Final Grade (11 acres) - portion of this area (estimated at 6.1 acres) is ready for placement of soil and seeding, if there is adequate moisture during the winter/spring of 2021: dashed line shows approximately boundary.
- Access road is permanent, post-mining feature.
- Blue triangles are storm water retention basins and are currently all empty of water. They are permanent, post-mining features.
- Currently investigating potential of a technical revision or amendment, to be done concurrently with Wallace Pit to North, to allow daylighting the permit boundary between the two properties to recover additional construction materials and improve post-mining land use further.

Based on site inspection/recon performed on 18 October 2020 by Nathan Barton and Gareth Barton.

TOTAL PERMIT AREA of which only the northern portion is shown above.
