Denver, CO, 80203

Re: 2020 Annual Hydrology Report
CDRMS Permit C-1981-022, Oxbow Mining, LLC

Dear Mr. Simmons:

Please find enclosed one copy of the Annual Hydrology Report for the year 2020.

The report and site descriptions follow the format of the revised hydrologic monitoring program approved as a result of the PR-04 Permit Revision and TR-47.

Please contact me if you have any questions concerning the contents of the report.

Sincerely,

Doug A. Smith
Chief Engineer

Re: 2020 Annual Hydrology Report
CDRMS Permit C-1981-022, Oxbow Mining, LLC

To Whom It May Concern:

In accordance with the requirements of Federal Coal Lease COC- 61357, *Special Stipulation Section 15(d)(1) Water Replacement Plan*, please find attached one copy of the Oxbow Mining, LLC., CDRMS Annual Hydrology Report for the year 2020.

Please contact me at 970-929-6034 if you have any questions concerning the contents of the report.

Sincerely,

A handwritten signature in black ink that reads "Doug A. Smith".

Doug A. Smith
Chief Engineer

Exhibit No. 1 – Surface Water Information

Exhibit No. 2 – Ground Water Information

1.1 Introduction

Oxbow Mining, LLC owns the now closed and reclaimed Elk Creek and Sanborn Creek Mines. The surface facilities for the mines are located immediately north of the town of Somerset, Colorado in Gunnison County. The Sanborn Creek Mine portals were located about one mile east and the Elk Creek Mine portal is located about a half mile north of the office facilities, the town of Somerset and State Highway 133. Coal from both mines had been conveyed to surface facilities where storage, processing (screening and crushing) was conducted. The coal was then loaded onto unit train rail cars for shipment to customers. A limited amount of coal had historically been transported by highway truck from the facilities to a nearby loading and crushing facility (Terror Creek Loadout) where sized coal products were provided to customers. In early 2003 the Sanborn Creek mine completed mining of the last longwall panel, the mining equipment was removed and the mine was sealed and the portals reclaimed. In 2015 the Elk Creek Mine portals were sealed and demolition, backfill and grading was completed in 2018.

The Sanborn Creek and Elk Creek Mines' surface facilities are located within the North Fork of the Gunnison River drainage, which is a tributary to the Colorado River. The North Fork drainage ranges in elevation from 5,550 feet to 12,000 feet and drains 1,253 square miles. The average annual discharge of the North Fork of the Gunnison River at the U.S. Geological Survey gauging station 2.3 miles east of Somerset is 313,300 acre feet of water, or an average discharge of 457 cubic feet per second. Peak flows generally occur in May as a result of snowmelt with minimum flows occurring during the winter months.

Surface drainage from the CDRMS permit area runs directly to the North Fork of the Gunnison River. One perennial, one intermittent, and eleven ephemeral creeks and gulches drain the permit area. From west to east, the creeks shown on CDRMS permit drawing 2.04-M6 are known as:

Hubbard Creek	Perennial
Bear Creek	Ephemeral
Elk Creek	Ephemeral
Sanborn Creek	Ephemeral
Unnamed Drainage	Ephemeral
Coal Gulch	Ephemeral
A-Gulch	Ephemeral
B-Gulch	Ephemeral
C-Gulch	Ephemeral
Hawksnest Creek	Ephemeral
Hoopla Gulch	Ephemeral
Bardine Canyon	Ephemeral
Thompson Creek	Intermittent

1.2 Monitoring Information

The hydrologic monitoring parameters and the schedules for the hydrologic monitoring programs are presented in Section 2. The monitoring sites, parameters and schedules have evolved over time as the facility has evolved and changed. The current monitoring program was substantially modified in 2001 per Permit Revision PR-04 and further modified in TR-47 in 2004. The current monitoring program can be found in Exhibit 2.05-E7 – Hydrologic Monitoring Plan of the CDRMS permit.

Field parameters for groundwater are depth to water level, pH, conductivity, and temperature. Field parameters for surface water are flow, pH, conductivity, dissolved oxygen and temperature. Equipment and methods used to measure the field parameters include:

- Depth to water level - A cable marked in increments is lowered into the groundwater monitoring well until electrical continuity is reached at the water surface.
- pH – An Oakton Instruments pH Testr basic pocket-size tester is used to measure the pH of a water sample. Published specifications for the pH Testr are range: pH - 0.0 to 14.0, resolution: 0.1 pH, accuracy: ± 0.1 pH, automatic temperature compensation, up to 3 point calibration. The pH tester is calibrated prior to sampling events using the 2 point method. The expected pH is bracketed by the pH of the calibration solutions. In most cases the pH tester is calibrated to 7 and 10 which brackets all of the current monitoring results. If an expected pH is less than 7, the pH tester can be calibrated at 4 and 7.
- Conductivity - A Cole Parmer pocket-size TDS Testr 3 or TDS Testr 4 is used to measure the conductivity of a water sample. Published specifications for the TDS Testr 3 are range: 0 to 1990 uS, resolution 10 uS, accuracy: $\pm 2\%$ full scale, automatic temperature compensation: 0 to 50 degrees C, calibration with standard solution. Published specifications for the TDS Testr 4 are range: 0 to 19.90 mS, resolution: 0.1 mS, accuracy: $\pm 2\%$ full scale, automatic temperature compensation: 0 to 50 degrees C, calibration with standard solution.
- Temperature - A standard mercury thermometer that measures temperature in degrees Celsius is used.
- Flow - The flow is measured in one of four different ways. The first method is to utilize a known culvert size combined with the depth of flow and the velocity determined by measuring the time it takes a floating object to travel a known distance or using a flow meter. The second method is to time flow into a bucket of known size. The third is to measure the length, width, depth, and the velocity of a stream of water or sum the flows measured in segments of a larger stream of water. The fourth way, used to find the flow of the North Fork of the Gunnison and Hubbard Creek, is obtained from the nearby USGS gauging station or alternative if the station is not available.
- Dissolved Oxygen – An EXTECH Model 407510 Dissolved Oxygen Meter is used to measure dissolved oxygen with a remote sensor also containing a thermister for measuring temperature. The DO range is 0.0 – 19.9 mg/l ± 0.4 mg/l with 0.1 mg/l resolution. Before use, the meter is calibrated according to the meter calibration procedure. This meter also provides temperature readings in F or C degrees.

Historically, water samples from groundwater wells H-10 and B-6 had been taken with a bailer that had a restricted inlet. The bailer is weighted so it sinks to the bottom of the well when it is empty. The water flowed into the bailer slowly so a sample of the water from the bottom of the well was obtained. It was not possible to purge wells H-10 and B-6 because they were connected to the flooded mine workings. With the exception of 2009, recently H-10 well has been dry resulting in no samples being obtained. Because of mine development activities in the Bear Creek drainage during 2004, B-6 was sealed.

Typically, water samples from groundwater wells are obtained with a bailer after the wells have been bailed to remove the equivalent of at least one volume of water from the wells. Because of regional drought conditions a number of wells often experience lowered water levels and reduced inflows. Some wells simply continue to monitor limited water containing zones. In such cases, water levels may often be obtained but water samples are not available. Often, limited volumes of water are obtained with the bailer and some samples may contain sediment moved from the “disturbed” bottom of the well.

Pre 2010, SGS (formerly Commercial Testing & Engineering Co.) of Denver, Colorado, completed the laboratory analyses of the water samples. Post 2010, Enviro Chem Analytical, Inc. of Grand Junction, Colorado completed the laboratory analysis.

These analyses are summarized on the tables and graphs found in this report. The original copies of the laboratory analytical results are stored in the OMLLC offices and available for inspection by CDRMS during complete quarterly inspections. Copies of the specific laboratory reports are also available upon request.

2013 was the year where the mine was sealed in January because of a spontaneous combustion event in the longwall gob. Attempts to recover the mining equipment were thwarted in September 2013 when the mine was reopened and the spontaneous combustion later re-ignited. The portion of the mine containing the longwall was resealed and mine was temporarily idled on December 5, 2013. In December of 2015, the portals to the Elk Creek Mine were sealed and backfilled. The shafts were backfilled and capped. From November 2017 to March of 2018, the middle pad of the Elk Creek Mine property was reclaimed and the creek bed was restored in this area. During May 2018 to September 2018, the lower pad, which was used for coal storage and handling, was reclaimed and the creek bed was restored in this area as well.

2.0 Monitoring Requirements

2.1 Hydrologic Monitoring Parameters

The ongoing water quality monitoring parameters list is presented in Table 2.04.7-T1 (page 2.04-41) and Exhibit 2.05-E7 of the OMLLC permit and presented again as follows.

<u>Ground Water</u>		<u>Surface Water</u>	
<u>Parameter</u>	<u>Units</u>	<u>Parameter</u>	<u>Units</u>
Water Level (Field)	feet	Flow	gpm/cfs
pH (field & lab)	standard	pH (field & lab)	standard units
Conductivity(field and lab)	uS/cm	Conductivity(field and lab)	uS/cm
Temperature	celsius	Temperature	celsius
		*Dissolved Oxygen	mg/l
Total Dissolved Solids(TDS)	mg/l	Total Dissolved Solids(TDS)	mg/l
		Total Suspended Solids(TSS)	mg/l
Alkalinity	mg/l	Alkalinity	mg/l
Ammonia	mg/l		
Bicarbonate	mg/l	Bicarbonate	mg/l
Calcium	mg/l	Calcium (Tot)	mg/l
Carbonate	mg/l	Magnesium(Tot)	mg/l
Chloride	mg/l	Chloride	mg/l
Nitrate/Nitrite	mg/l	Nitrate/Nitrite	mg/l
Phosphate	mg/l	Phosphate	mg/l
Sodium (Dis)	mg/l	Sodium (Dis)	mg/l
Sulfate	mg/l	Sulfate	mg/l
Arsenic (Dis)	mg/l		
Cadmium (Dis)	mg/l		
Iron (Dis)	mg/l	Iron (Dis)	mg/l
Iron (Tot)	mg/l	Iron (Tot)	mg/l
Manganese (Dis)	mg/l		
Manganese (Tot)	mg/l	Oil and Grease	visual
Zinc (Dis)	mg/l		

Note: The August water sample for the two North Fork of the Gunnison River sites will also be analyzed for the parameters of hardness, ammonia, cyanide, arsenic, silver, boron, cadmium, chromium III and IV, chlorine, mercury, manganese (dis), nickel, lead, selenium and zinc.

Tot = Total Recoverable

Dis = Dissolved

* Dissolved Oxygen – Dissolved oxygen will be monitored only for streams.

2.2 Hydrologic Monitoring Schedule

CDRMS Permit Revision PR-04 and TR-47 provide the most recent modification and definition to the ongoing hydrologic monitoring program. The following list describes the present monitoring sites.

<u>Station</u>	<u>Frequency</u>	<u>Elevation</u>	<u>Location</u>	<u>Water Type</u>
Wells				
BC-1	Note 3	6000	Lower Bear Creek	Colluvial Well – Down Gradient
EC-14	Note 3	6400	Upper Elk Creek	Colluvial Well – Up Gradient
EC-15	Note 3	6300	Mid Elk Creek	Colluvial Well – Mid Gradient
H-10	Note 3	6376	Hubbard Creek	Ground Water – Down Gradient
SC-1	Note 3	6106.1	Drill hole	Somerset Mine B seam workings
SC-3	Note 3	6227.8	Drill hole	Ground Water – Rollins SS
D2B	Note 7	6415	Upper Elk Creek	Ground Water – D Seam
D2B2	Note 7	6385	Hubbard creek	D to B Seam Water Transfer Well
Streams				
B-1	Note 1	6000	Lower Bear Creek	Surface Water – Down Gradient
B-2	Note 8	6800	Mid Bear Creek	Surface Water – Down Gradient
B-3	Note 8	7400	Upper Bear Creek	Surface Water – Up Gradient
C-1	Note 1	6070	Lower Coal Gulch	Surface Water – Down Gradient
E-1	Note 1	6000	Lower Elk Creek	Surface Water – Down Gradient
E-2	Note 1	6400	Upper Elk Creek	Surface Water - Up Gradient
H-1	Note 1	6100	Lower Hubbard Creek	Surface Water – Down Gradient
HN-1	Note 1	6200	Hawksnest Creek	Surface Water – Down Gradient
NF-1	Note 2	6080	N. Fk. Gunnison River	Surface Water – Up Gradient
NF-3	Note 2	5910	N. Fk. Gunnison River	Surface Water – Down-gradient
S-1	Note 1	6080	Upper Sanborn Creek	Surface Water – Up Gradient
USGS Gage	Note 6	6080	N. Fk Gunnison River	Surface Water
Springs and Seeps				
SP-8	Note 4	6200	Spring	Ground Water – slump feature
SP-9	Note 4	6200	Spring	Ground Water – slump feature
Mine Water Discharge				
Outfall 015	Note 5	6400	Elk Creek Mine	Mine Water

NOTES:

1. Monthly flow and field parameters - April through October. One full suite analysis during 2nd and 3rd quarters if available.
2. Same as Note 1 plus monthly field parameters and 4th quarter full suite analysis.
3. Field parameters twice, June through October. Full suite 3rd quarter if sample is available.
4. Discharge and field parameters twice during June through October.
5. CDPS requirements including quarterly WET testing.
6. USGS Gage used for stream flow purposes only.
7. D to B Seam water transfer well D2B is monitored for annual flow, TSS, pH and water level twice/year. D2B2 well is sealed
8. B-2 and B-3 are surface flow and field parameters only.

3.0 Surface Water Information

The data collected from Oxbow Mining, LLC (OMLLC) surface water monitoring sites along with the results of laboratory analyses are presented in Exhibit 1- Surface Water Information.

The following site discussions are presented from west to east through the OMLLC property.

H-1 – Lower Hubbard Creek

Surface water monitoring point H-1 is located on Hubbard Creek, where this perennial stream flows through the western edge of the OMLLC permit area associated with the abandoned but reclaimed Somerset Mine facility area and Blue Ribbon Mine Facility. Until 1996, the most recent surface activity in the area was the reclamation of the lower Hubbard Creek site. Mining activities also included the upper Hubbard Creek facilities area and the reclaimed Blue Ribbon Mine facility. In 2005 the Hubbard Bleeder Fan site, associated with the Elk Creek Mine, was permitted and constructed. During 2007, Bowie Resources, Ltd started construction of a ventilation shaft facility on lands managed by the USFS. The Bowie site is located adjacent to Hubbard Creek and up gradient of the Hubbard Creek facilities. The Bowie shaft construction continued into 2008 as did use of the upper Hubbard Creek facilities as a project staging area. Hubbard Creek is a stream that also serves as a trans-basin diversion from the Terror Creek reservoir during the summer irrigation season. The Hubbard Creek drainage and the Delta County two track road is also used extensively by USFS and BLM recreationists and other Bowie Resources mining related activities.

During 2009, the Blue Ribbon Mine received final Phase III bond release from CDRMS. Oxbow initiated reclamation rough grading of the Hubbard Fansite in 2010 and completed reclamation and seeding in 2011. The Bowie Hubbard Fansite was reclaimed and seeded in 2011.

The H-1 site is, in theory, utilized as a down gradient site to detect potential changes in stream quality or quantity as a result of mining activities. Hubbard Creek point H-1 was monitored in accordance with the permit requirements. Hubbard Creek continues to exhibit summer flow volumes in response to the management of upstream diversions and regional snow conditions. Hubbard Creek flows returned to normal flows during 2020. Nitrate/nitrite, total iron, chloride and sulfate appeared to fluctuate in 2011 and/or 2012 but otherwise, no significant difference in the 2020 monitoring results from baseline or historical measurements were noted. There appears to be no mining related impacts.

B-1, B-2 and B-3 – Bear Creek

The Bear Creek canyon light use road is used extensively to access the upper reaches of Bear Creek for cattle and sheep grazing, logging, hunting, mine exploration and borehole reclamation activities, natural gas operation and support companies, etc.

B-1 -- Surface water monitoring point B-1 - Lower Bear Creek, an ephemeral drainage, is monitored as a down gradient site to “verify” that the Elk Creek mine does not have an adverse

affect on the quality of runoff in the drainage. During 2020 there was, typical flow to no flow at B-1 after the conclusion of spring snowmelt.

Retreat mining of D seam ended under the Bear Creek drainage during 2008. The status of the Bear Creek road is assessed as part of ongoing subsidence monitoring. No adverse effects as a result of mining activities (or the multitude of other uses) were observed to have occurred to the Bear Creek road or Bear Creek water quality in 2020. From a historical perspective it is important to remember that, in addition to all of the surface uses of the Bear Creek drainage, the Bear Creek drainage was also undermined by extensive historic mine workings in the B and C seam of the Somerset Mine.

B-2 and B-3 -- In accordance with the Elk Creek Federal Coal Lease COC-61357 "Water Replacement Plan" stipulation, surface water monitoring points B-2 and B-3 are monitored for flow twice annually after tributary flow from side channels between the two points has ceased. B-2 corresponds to a mid-Bear creek location roughly corresponding to the south limit of the Elk Creek Federal Coal Lease. B-3 corresponds to an upper Bear Creek location roughly corresponding to the north limit of the Elk Creek Federal Coal Lease. Generally, due to the ephemeral nature of Bear Creek and the propensity for flows to quickly cease by late June, flow measurements are most often obtained in mid-June.

BEAR CREEK FLOW INFORMATION

Date	Site B-2	Site B-3
June 10, 2003	0.25 cfs	0.21 cfs
June 16, 2003	0.097 cfs	0.088 cfs
June 15, 2004	0.02 cfs	0.041 cfs
June 22, 2004	0.0 cfs	0.0174 cfs
June 15, 2005	1.036 cfs	1.085 cfs
June 30, 2005	0.39 cfs	0.13 cfs
June 7, 2006	0.047 cfs	0.033 cfs
June 13, 2006	Trace flow	Trace flow
June 15, 2007	0.21 cfs	0.34 cfs
June 28, 2007	Trace flow	Trace flow
June 18, 2008	1.29.cfs	0.72 cfs
June 25, 2008	0.49 cfs	0.67 cfs
June 17, 2009	0.55 cfs	0.46 cfs
June 25, 2009	0.65 cfs	0.63 cfs
June 4, 2010	3.3 cfs	1.5 cfs
June 11, 2010	0.67 cfs	0.67 cfs
June 14, 2011	2.3 cfs	1.85 cfs
June 28, 2011	1.35 cfs	1.92 cfs
June 8, 2012	0.0 cfs	0.0 cfs
June 13, 2012	0.0 cfs	0.0 cfs
June 3, 2013	0.257 cfs	0.22 cfs
June 24, 2013	0.0 cfs	0.0 cfs
June 12, 2014	0.5 cfs	0.63 cfs
June 17, 2014	0.42 cfs	0.12 cfs
June 16, 2015	0.3 cfs	0.62 cfs
June 24, 2015	0.13 cfs	0.13 cfs
June 10,2016	0.23 cfs	0.18 cfs
June 23, 2016	0.0 cfs	0.0 cfs
June 6, 2017	1.2 cfs	1.4 cfs
June 13, 2017	0.65 cfs	0.74 cfs
May 14, 2018	.05 cfs	.05 cfs
June 23, 2018	0.0 cfs	0.0 cfs
June 7, 2019	4.7 cfs	4.7 cfs
June 20, 2019	2.4 cfs	2.4 cfs
June 2, 2020	.07 cfs	.09 cfs
June 12, 2020	.02 cfs	.02 cfs

The information is collected in order to aid in analyzing 1) potential water depletions and 2) potential for injury to any Bear Creek water rights. Bear Creek stream flows ceased during the usual mid to late June timeframe. A spike in 2011 total iron levels appeared tied to TSS and seemed “normal” in 2014. A spike in 2012 chloride level occurred for no apparent reason and again in 2017 and 2018. No mine activity was performed within the Bear Creek drainage during 2018. Some 2009, 2010 and 2011 reduced levels of sodium, calcium, conductivity, TDS, and bicarbonate alkalinity appeared to remain at historic levels. The orthophosphate spike remains under the minimal 0.09 mg/l level. Here the importance in the role of the scale of the Y axis seems to predominate. Analysis of the 2020 data, as well as subsidence monitoring and observations in the field, suggests no significant anomalies or any indication of adverse effects attributable to mining activities.

E-1- Lower Elk Creek

Surface water monitoring point E-1 - Lower Elk Creek, an ephemeral drainage, is monitored as a down gradient site to verify that the Elk Creek Mine and the surface facility located at Somerset does not have an adverse effect on the quality of runoff in the drainage. During spring snowmelt, elevated levels of TSS and Total Recovered Iron are routinely encountered, presumably from natural upstream erosion in the unstable Elk Creek drainage, until stream flows subside. Naturally occurring slide blocks exist in the Elk Creek headwaters and no doubt contribute additional sediment loading.

Of particular note are the possible lingering effects of pumping the two mine recovery boreholes #1 and #2 during 3 months in 2013. Elevated levels of TDS from naturally occurring alkalinity were noted in the E-1 sampling during 2013. The additional pumping flows extended the 2013 runoff period in Elk Creek. Elevated dissolved solids raised conductivity measurement during pumping, but quickly returned to “normal” after pumping was terminated on September 9, 2013. Data beyond 2014 indicate no lingering effects from the pumping. The boreholes were sealed in 2015. The road and pad for these holes were reclaimed and seeded in 2016.

Mine activities in 2017 included reclamation of drill hole pads and roads above the Elk Creek drainage. This minimal activity should not have impacted the creek, but chloride levels appear to be elevated for both E-1 Lower Elk Creek and for E-2 Upper Elk Creek in 2017, 2018, 2019 and into 2020. The levels seen in 2019 corresponds with very high flows due to high snow pack levels. E-2 chloride levels, which is upstream of actual mine facilities, typically are higher or match the E-1 levels downstream of the mine facilities. This would indicate that restoration of portions of the Elk Creek stream channel during 2017 and 2018 had no effect on sample results.

An analysis of the data suggests there is no adverse impact of the Elk Creek Mine to Lower Elk Creek.

E-2- Upper Elk Creek

Surface water monitoring point E-2 - Upper Elk Creek, an ephemeral drainage, is monitored to verify that the Elk Creek mine does not have an adverse effect on the quality of runoff in the drainage. In addition, the site will serve as an up-gradient site to monitor Elk Creek prior to entering the OMLLC surface facility. See the above comments for site E-1 for the discussion on the dewater recovery boreholes.

An elevated September 2014 and July 2015 chloride levels appear to be anomalies, as the down dip site does not show a similar chloride level. An analysis of the data suggests there is no adverse impact of the Elk Creek Mine to the upper Elk Creek site or the segment of Lower Elk Creek in particular. See above in E-1 for discussion on 2020 chloride levels.

S-1 – Upper Sanborn Creek and S-2 – Lower Sanborn Creek

Surface water monitoring points S-1 - Upper Sanborn Creek and S-2 – Lower Sanborn Creek were established to monitor the flow in ephemeral Sanborn Creek above and below the disturbed area of the Sanborn Creek Mine site. Historically, Sanborn Creek also received mine water discharge from the Sanborn Creek Mine, consisting primarily of natural mine water inflows and some runoff of imported (from the North Fork intake) water from the mining sections. The mine water discharge (CDPS discharge point 011) commingled with upper Sanborn Creek flow for a distance of approximately 300 feet through culverts under the railroad and highway prior to discharging into the North Fork of the Gunnison River. The S-2 sample site is located at the outlet of the culvert, prior to the confluence with the river. Because of the 2003 closure of the Sanborn Creek mine, and the termination of discharge Outfall point 011, the S-2 sample site was no longer needed and, thus, eliminated from the OMLLC hydrologic monitoring program in 2004. (see TR-45).

Sanborn Creek, an ephemeral stream, flows at monitoring point S-1 during spring runoff and significant precipitation events. During 2019, S-1 had slightly higher than normal flows and ran through June. In 2020, flow stopped in April, so no lab analysis is available. An analysis of the limited data shows somewhat elevated magnesium in 2014. The data is variable but suggests there is no adverse impact of the Sanborn Creek Mine to Sanborn Creek.

C-1 – Lower Coal Gulch

Surface water monitoring point C-1 - Lower Coal Gulch, an ephemeral drainage, is monitored to verify that the Sanborn Creek mine does not have an adverse effect on the quality of runoff in this drainage. During 2020 there was, again, minimal flow in Coal Gulch during spring snowmelt, and no flow after snowmelt was completed. No lab analysis was conducted. Elevated levels of chloride are noted in 2016 through 2019. An analysis of the all of the data suggests there is no adverse impact of the Sanborn Creek mine to Lower Coal Gulch.

NF-1 and NF-3 – North Fork of the Gunnison River

Surface water monitoring points NF-1 (North Fork upstream) and NF-3 (North Fork downstream) were selected to monitor the water quality in the North Fork of the Gunnison River above and below the disturbed surface mine site of the Sanborn Creek and Elk Creek Mines. Monitoring point NF-3 was established in September 1997 to monitor for any mining-related water quality impacts from the West Valley coal refuse pile. It should be noted that NF-3 is also downstream from the town of Somerset and monitoring results for this station most likely include impacts from domestic water use, possible leakage from sanitary sewers, the Bear Mine discharges, and other factors that are not related to the Sanborn Creek or Elk Creek Mines. Similarly, both sample locations are located downstream of the adjacent Mountain Coal Company, West Elk Mine discharge points and potentially other less distinct historic mine discharges scattered along the river.

Flow in the river reflects natural seasonal flows from upland drainages plus regulated flows from Paonia Reservoir and significant other upland irrigation water storage facility releases during the summer irrigation season. During 2019, flows appear to be consistent with flows measured in 2018. During September of 2017 river flows contained significant amounts of sediment from sediment scouring activities of the Paonia Reservoir. Summer and early fall flows reflect discharges from upland storage reservoirs used downstream by the water rights holders. Irrigation water return from upstream agriculture activities does also occur.

Charted cyanide levels are related to the Lab MDL. No significant changes were noted, however, in the analytical data. There is nothing in the data to suggest adverse impact by the Elk Creek Mine or Sanborn Creek Mine to the River.

The water flows for the North Fork are obtained from the USGS Gauging station located on the river upstream of the mine. Discussion took place with USGS regarding the future of the station in light of funding challenges. If the data from the station becomes unavailable, some other mechanism may have to be employed for flow data.

HN-1 – Lower Hawk's Nest Creek

Surface water monitoring site HN-1 Lower Hawk's Nest Creek, is monitored to verify that the Sanborn Creek Mine does not have an adverse effect on the quality or quantity of runoff from this ephemeral drainage. During 2017 there was, again, minimal flow in Hawk's Nest Creek during spring snowmelt, and no flow after snowmelt was completed. Higher sulfate levels seen in 2011 appeared to return to normal in 2013. In 2019, flows returned to normal. An analysis of the data suggests there is no adverse impact of the Sanborn Creek Mine to Lower Hawk's Nest Creek.

4.0 SEEP AND SPRING INFORMATION

Two spring monitoring points, SP-8 and SP-9 are monitored and the results compared with baseline and historic monitoring data. A significant change in the quality or quantity of flow from these springs and seeps after retreat mining might indicate that the Sanborn Creek Mine might be impacting these water resources.

The data collected from Oxbow's groundwater monitoring stations, along with the results of laboratory analyses are presented in Exhibit 2 – Groundwater Information.

Spring SP-8

Based on the quality and location of spring SP-8, it was determined that the source of the spring was the abandoned Oliver Mine. Until 1999, flows from this spring were relatively consistent. No flows were recorded during any of the 2001 through 2014 monitoring events. Based solely upon coincidence, Oxbow believes that water from the Oliver Mine may have drained into the Sanborn Creek mine at the time of the 1999 mine fire event. Since this event occurred, no flow from spring SP-8 has been recorded.

Spring SP-9

Spring SP-9 is a seep located at the base of a landslide feature in the Unnamed Gulch. Historically, flow had been nearly continual, but at very low rates. The source of the spring appears to be a shallow perched water zone discharging from the toe of a surface slide feature. During 2020 the spring SP-9 did not flow.

5.0 Ground Water Information

The data collected from Oxbow's groundwater monitoring sites, along with the results of laboratory analyses are presented in Exhibit 2 – Groundwater Information.

The following site discussions are presented from west to east through the OMLLC property.

H-10 Well – B-Seam – Somerset Mine Workings – Hubbard Creek Drainage

The sealing of all of the abandoned, historic Somerset Mine portals has precluded access into the mine to obtain underground mine water samples from those abandoned workings. Instead, since the Somerset mine was closed in 1985, monitoring wells H-10 and B-6 had historically been utilized to monitor potential groundwater inflow and quality in order to predict the extent of flooding in the abandoned underground workings. Monitoring water levels in these two wells served as a valuable predictive tool as to whether water from flooded mine workings could impact the hydrologic balance.

The H-10 well is located in Hubbard canyon near the western limit of underground B seam mining of the Somerset mine and near the north or down-gradient limit of the old mine workings in that specific area. The elevation of the B seam in the well is ~ 6018 feet. From 1987 to 1989, the water level in H-10 held steady at about elevation 6028 feet, and then in 1992 rose to approximately 6068 feet in elevation. From 1989 until 1999, the water level ranged from 6067 feet to 6069 feet in elevation. In October 1999 and 2000 through 2008 no water could be measured in the well. In 2009 the water level elevation was found to have reestablished and ranged from 6088.7' to 6090'. In 2010 through 2020, no water has been measured in the well.

Starting in 2006, the H-10 well was to have been used to monitor any B seam water level resulting from the transfer of water from the D seam workings to the B seam workings through borehole D2B2 located in the vicinity of the Hubbard Fansite. As of the data year 2008, no water level had been encountered in H-10. With the sealing of the western mining district and sealing of the Hubbard shaft on October 12, 2008, the pumping of water to D2B2 was halted.

The reestablishment of a water level in the well in 2009 likely indicated inflow into the abandoned mine workings in this vicinity. A comparison of the 2009 water quality data versus the earlier pre-1997 data indicates little change with the exception of increased dissolved and total iron concentrations and increased dissolved solids concentration, primarily as calcium. A lack of a water level in 2010 through 2019 indicates the variable nature of the ground water in the vicinity.

B-6 Well – B Seam – Somerset Mine Workings – Bear Creek Drainage

The B-6 monitor well is no longer in service and the following discussion is presented for historical reference.

“The B-6 well is also located in a down-gradient location in the abandoned Somerset Mine workings in the vicinity of Bear Creek canyon. The elevation of B seam in this vicinity is ~5925

feet. In monitoring the B-6 well, the historical fluctuation of water levels has been different than experienced in well H-10. After initially rising to elevation 6035 feet, the water level fell to elevation 6014 feet in 1990. Water levels then recovered, with an increase to elevation 6033 feet in 1992, and rising to elevation 6051 feet in 1993. The water level ranged from 6038 feet to 6048 feet in 1994 and 1995, and then rose to elevation 6054 feet in 1997. In 1998 the water level ranged between 6052 and 6053 feet in elevation.

Similar to monitoring well H-10, since October 1999 and during 2000 through 2004 no water was measured in well B-6. The lack of water in the H-10 and B-6 wells may be due to a blockage or another problem in the wells. The scenario that both wells failed at the same time appears, however, unlikely. Performance and condition of the bailer when raised during sampling do not suggest the wells were blocked.

A more plausible explanation is that because these two wells are located in two different drainages and both are dry suggests that the water level, thus inflow, into the abandoned Somerset Mine has simply decreased for some unknown reason. Curiously, this decrease is coincident with the time of the mine fire event and pumping from the North Fork into the Sanborn Creek Mine. Flows also ceased just a few months earlier from Spring 8 (believed to have been from the old Oliver Mine D-seam workings).

However, unlike the Oliver Mine, there is no portion of the abandoned B- and C-seam workings of the Somerset Mine that overlie the Sanborn Creek Mine. Rather, there is more than 200 horizontal feet of unmined B-seam coal barrier pillar separating and isolating the Somerset Mine B workings from the Sanborn Creek mine B workings.

OMLLC has held the belief through the years that should wells H-10 and B-6 continue to remain dry, the data supports the conclusion that the Somerset mine will continue to have a negligible affect on the hydrologic balance of the region. (See the following discussion regarding the D2B water transfer well for additional ground water discussions.)

In the fall of 2004, the Elk Creek Mine D seam development was to have intercepted the vicinity of the B-6 well. Because of the MSHA requirement to seal interconnecting mine openings in order to isolate mine atmospheres, the B-6 well was plugged with concrete on October 19, 2004. Upon entering the vicinity of the well, the steel casing was never actually encountered by the D seam continuous miner section and the casing remains intact within a coal pillar.”

BC-1 Well – Lower Bear Creek Canyon – Alluvium/Colluvium

The Bear Creek canyon light use road is used extensively to access the upper reaches of Bear Creek for cattle and sheep grazing, logging, gas company access, mine exploration and methane ventilation activities, hunting, etc. The two track, ranch road crosses Oxbow, BLM, and other private lands.

The BC-1 Well is located in the shallow alluvium/colluvium located near the entrance to Bear Creek canyon in the vicinity of the railroad trestle. The purpose of the well is to monitor possible groundwater changes down gradient from the Elk Creek Mine D seam mining activities

in the Bear Creek drainage area. In addition, it is important to note that the BC-1 well is also located down-gradient from the old Somerset Mine workings as well.

Groundwater in this ephemeral drainage appears closely linked to the variable surface water flow found nearby in Bear Creek. Soon after Bear Creek goes dry, typically, so drops the water level in the BC-1 well. During late 2006 the monitor well was damaged by a hunter's vehicle. No water samples could be taken during 2007 because of the damage. MR-85 addressed the re-drill of the monitor well which was completed on November 9, 2007. On June 18, 2008 and during the sampling event of August 8, 2008 attempts were made for the routine sample of the "new" well. We found that the well was "pushed over" making it un-useable once again. Repairs were made to the well on August 25, 2008 and the well successfully sampled on August 26, 2008. A large concrete barrier has been placed in front of BC-1 to prevent additional damage.

During 2020, Bear Creek had routine normal spring snow melt flows followed by the usual complete absence of flow during the dry season.

During 2020, water samples were available in BC-1. Analysis of the BC-1 data suggests no recent anomalies or long term trends.

EC-14, EC-15 Wells - Elk Creek – Alluvium/Colluvium

The EC-14 well is located up gradient of the EC-15 well. The EC-14 well is located in undisturbed alluvium/colluvium up-gradient from the Elk Creek mine surface facility but down-gradient from the eventual D seam mining area located in the upper reaches of Elk Creek. The EC-15 well is located in alluvium/colluvium located south of the D seam portal area but north of the coal stockpile area. Changes in the hydrologic condition of shallow Elk Creek alluvial groundwater due to mining activities could potentially be monitored from these two wells.

The EC-14 monitor well was proposed to be moved upstream to accommodate the 2012 construction of a methane fueled, electricity generation facility. In 2012 the monitor well was redrilled so as to be located off of the methane facility. The old well was sealed and abandoned.

During 2020, water levels in the wells were seasonably variable.

Both wells showed elevated levels of chloride and zinc in 2012 for no apparent reason, but the 2013 levels appeared to return to "normal" During 2014, chloride was elevated in both, but zinc seemed elevated only in EC-15. There was an EC-14 chloride spike in June 2017, but levels returned to normal in September. EC-15 also had a spike in chloride in June 2017, but was dry in September. Elevated chloride and manganese levels continued in both wells during 2017 through 2020. Zinc in EC-14 and EC-15 has stabilized at slightly elevated levels. Overall, analysis of the data for these wells suggests no anomalies or effects attributed to mining.

D2B and D2B2 Mine Water Transfer Wells ("D seam to B seam")

The purpose of these two boreholes was to transfer mine water from the D seam Elk Creek mine workings to the underlying Somerset B/C seam workings. The depth to water is to be measured

at the same frequency as the overall OMLLC groundwater monitoring program. Data is also to be collected regarding 1) annual total volume of water transferred, 2) representative pH of transferred water and 3) representative TSS of transferred water.

D2B

The D2B mine water transfer well was drilled and completed in late December 2004 in the vicinity of the upper Elk Creek facilities area. When the drill penetrated the B Seam workings, it was apparent that this portion of the B seam mine was flooded with water. The B seam was encountered at the 5918' elevation and a static water level later appeared at the 6042' elevation. Water transfer operations first began in early 2005 for D2B. During late 2011, the D2B water meter failed and had to be replaced. During 2012, we estimate that 81 million gallons of water was transferred. During 2013, with the sealing and later idling of the Elk Creek mine due to the spontaneous combustion event behind the longwall no water was transferred during the year. In 2015, the Elk Creek Mine was sealed and no water pumped since that time. The water level returns to the 6051' elevation.

The floor of the historic Somerset B Seam Mine portal is at the approximate 6090' elevation, so there remains approximately 39' of elevation remaining before the water could exit the mine at that location.

D2B2

The D2B2 borehole was completed in December 2005 in the vicinity of the Hubbard Fan. Water transfer started during early 2006. The bottom 39' of the 338' borehole is uncased. The B seam coal roof was encountered at 6046' elevation. After initial water transfer, initial water level was encountered at 6053' elevation, or 7' above the coal. Subsequent measurements encountered an apparent dry borehole obstruction at the 6070.7' elevation or 24' above the coal. The obstruction has not precluded water transfer, but has limited the ability to lower the sounder past the obstruction. During 2008, the sounder encountered more favorable conditions and a water level appeared at the 6064' elevation. During 2008 the underground pumps ran very little. On October 12, 2008 the 13 West gate road was sealed, the Hubbard fan dismantled, the shaft sealed with earthen materials and the western mining district sealed off. Pumping of water to D2B2 was also concluded. The reclamation and seeding of the Hubbard fansite was completed in early 2012.

June 19, 2020	6053.5	Borehole is sealed
September 14, 2020	6051	Borehole is sealed

The data suggests no unexpected anomalies to the B seam water level.

Initially, once a year, samples of water were taken of water transferred to D2B and D2B2 and summarized below. The access to the pumps leading to D2B2 is permanently sealed with the sealing of the West District. A representative D2B data from the 2013 dewater borehole is presented here. There is no more transfer as the Elk Creek mine is sealed. No issues were ever encountered with respect to the analytical results.

SC-1 Well – Rollins Sandstone

Monitor well SC-1 is located just east of the reclaimed Sanborn Creek mine portal area.

Well SC-1 was completed in the Rollins Sandstone, which is located 40 to 50 feet below the B-Seam. Monitoring data were historically collected from well SC-1 prior to any substantial mining in the B-Seam of the Sanborn Creek Mine. The SC-1 well is located up-gradient relative to the Rollins Sandstone unit which is located stratigraphically under the footprint of the mining activities.

Water in the Rollins Sandstone is confined to limited localized zones that are fractured and/or contained above the Rollins, as evidenced by past water level measurements that are well above the top of the sandstone member. Water quality is poor, with high total dissolved solids as sodium chloride. Inflow and recovery of the water level in the drill holes indicates very low permeability and porosity of the sandstone. The 2012 sampling indicated a substantial drop in dissolved solids, chlorides, etc. These parameters appeared to return to “normal” in 2013. A review of the long term water level appears to show a continuous drop in water level elevation, suggesting low transmissivity of water into the sandstone from the up gradient river. In 2014 the water level was so low there was barely enough to trip the sounder recording the water level. During 2016, there was insufficient water for bottled samples. Water levels returned in 2017, 2018 and in 2019, enough so that chemical analysis was barely possible. The waters return and low level may explain elevated manganese TR, Iron D and a calcium spike.

Generally, the limited water quantity and poor water quality suggests there is limited transmissivity between the North Fork of the Gunnison River alluvium through the Rollins sandstone down-gradient towards the area associated with the Sanborn Creek Mine.

SC-3 Well - B-Seam Coal – Sanborn Creek Mine

Monitor well SC-3 is located east of the Sanborn Creek reclaimed mine portal area along the entrance to the pre-existing ranch road to Coal Gulch.

Monitoring well SC-3 was completed into the B Seam coal. Monitoring data were collected from well SC-3 prior to any substantial mining in the B-Seam of the Sanborn Creek Mine. The SC-3 well is up-gradient relative to the B seam underground mining activities but down-gradient from the North Fork of the Gunnison River

The plastic pipe casing is squeezed at the 20 foot level making it difficult to lower a bailer. Using a smaller diameter bailer we have found very minimal water available in the well. In fact there are times when the initial bailing of the well to remove one volume effectively drains the available water. The lack of water in the well and the poor water quality suggests there is little transmissivity and connection between the North Fork of the Gunnison River and the B seam coal at this particular vicinity of the mine. The elevated 2012 levels of zinc and iron appeared to return to “normal” but sulfate seemed to remain elevated. Perhaps the lack of water in the well is skewing the results. Overall depth appears to be “normal”. The well was again dry in 2018, but returned in 2019. Sulfate returned to normal, but chloride remains elevated.

As the locations of SC-1 and SC-3 wells serve to monitor only the Rollins sandstone and B-seam coal respectively up-gradient of the Sanborn creek mining area, their utility towards the monitoring of the Sanborn Creek mine itself remains somewhat limited.

6.0 Mine Water Information

Elk Creek Mine Water

The water utilized at the mine property continues to be all imported from the alluvial water supply well located near the North Fork of the Gunnison River per the OMLLC water rights and Augmentation Plan.

During 2012, the 4 West and 5 West seals flowed at a combined rate of 12.3 gpm. The 13 west entry 1 seal flowed ~80 gpm. The 4B entry 10.5 crosscut flowed 2.69 gpm. The 4N entry, 3 E crosscut flowed 23.08 gpm.

During 2013, the mine was sealed or idled for most of the year. An assessment of mine inflows was not possible during 2013 but it is likely similar to 2012. During 2014 the mine remained idle and at the end of 2015 the mine was permanently sealed.

See the D2B and D2B2 well discussion above for information regarding the transfer of collected Elk Creek mine sump water to the abandoned Somerset B/C seam workings.

Water is no longer removed from the mine workings.

Outfall 011 – Sanborn Creek Mine Water Discharge

Outfall 011 was the OMLLC - CDPS mine water discharge point from Sanborn Creek Mine that discharged into Sanborn Creek

The Sanborn Creek Mine water drainage system was decommissioned on May 21, 2003. Since the mine completed the last panel, the underground hardware was removed and the entries were sealed in accordance with MSHA requirements.

During 2004, CDMG approved PAP TR-45 which removed Outfall 011 as a monitoring point.

Outfall 015 – Elk Creek Mine Water Discharge

Outfall 015 is a CDPS mine water discharge point for the Elk Creek Mine. The mine water discharge point provides for the discharge of mine water to Elk Creek. The Outfall 015 has never discharged. The mine is sealed and will not discharge again.

Outfall 015B – Elk Creek Mine Dewater Boreholes.

CDPS Permit No. CO-0000132 is the primary, current Permit for the Oxbow Mining, LLC., Elk Creek Mine. Outfall 015 is the primary dewater borehole for mine water. Due to unforeseen mine conditions and circumstances related to a spontaneous combustion event and temporary sealing of the mine by the Mine Safety and Health Administration (MSHA) Oxbow had proposed a temporary re-location for the mine water discharge Outfall 015 borehole to aid in mine recovery efforts. As Permit CO-0000132 was expired and operating under an Administrative Extension, CDPHE could not “modify” an expired Permit. Oxbow was instructed to submit an application for an alternative Outfall 015B. The alternative dewater borehole Permit application (March 26, 2013) resulted in the issuance (on April 16, 2013) of Permit COG-850064 for an alternative Outfall 015B. The resultant dewater borehole pump(s) operated from June 3, 2013 until September 9, 2013. Approximately 58,879,900 gallons (180.6 acre-feet) were subsequently pumped from the mine and discharged to upper Elk Creek. The pumps were later pulled and all hardware removed from the drill pads. On January 31, 2014 a request was submitted to CDPHE to terminate COG-850064. During the active pumping of the dewater boreholes, the water monitoring and reporting were conducted in accordance with the terms and conditions found in the COG-850064 Permit.

During 2015, both of the boreholes were sealed and will not discharge again.

The background of the image features a geological log with various color-coded zones. At the top, there is a pink zone with a wavy pattern. Below it is a thin blue line, followed by a light green zone. A prominent white horizontal line runs across the middle of the image. At the bottom, there is a yellow zone on the left, a thick pink zone in the center, and a dark grey/black zone on the right.
