

WALLACE PIT LOCATED TO NORTH AND EAST

No change in affected land below this line in remainder of the permit area.

AREAS AS LABELED ABOVE:

- A-B-C-D Areas to be mined in future: not disturbed as of November 2021.
- D While additional area is NOT expected to be disturbed in 2021-22, if additional area is needed, will be in Area D and Buffer Zone near it.
- W WAPA Power Pylon with required setback (not affected land)
- S Primary stockpile as presently configured. Other smaller transient piles of overburden and soil exist in the current mining area.
- BF (Buffer Zone) As shown is NOT affected, but some portions may be affected in the future as part of reclamation.
- Currently mining (19 acres): Active access roads, excavation and highwalls, plant locations, stockpiles of materials, overburden, and soil. Some internal transitory storm water basins and large stockpile S included. Additional areas are near final grade since 2020.
- At Final Grade (11 acres): while portions of this area are ready for placing soil and seeding (estimated at 6.1 acres) there was insufficient moisture in 2020-21 to ensure soil protection and revegetation. The area north of the dashed line still requires some final preparation before it is ready for placing topsoil. Precipitation in 2021-22 will determine if these areas can be prepared and seeded.
- Blue triangles are storm water retention basins but currently contain no water. They will be permanent post-mining features, as is the access road.
- No decision has yet been made on daylighting between Wallace Pit to the north and this pit, which would require multiple technical revisions or amendments.
