

## Exhibit D Reclamation Plan

Current mining of pit area has been completed the depth of mining averaged 5 ft of extracted pit run materials,

As extraction took place and as projects worked the pit has been refilled with import fill dirt back from projects completed through the excavation / construction business to the original grade before mining was started because of the amount of material brought back in and the need for space and room for equipment and materials storage we are asking that the mining reclamation plan be revised as follows and per the newly submitted reclamation plan and pictures included.

We for the purpose of use in our farm and excavation business do plan to keep the scales on site and in use for the weighing of hay products and the imported gravel products that we purchase and use on our various projects we do through the year. We have on our map shown where these piles are located of imported materials.

We are not doing any reseeding of the mining area as it will be used for parking and storage of our Trucks / Equipment and Project materials for the Construction business and farming equipment and hay storage for the farming business we run.
