

2.05.6 MITIGATION OF THE IMPACTS OF MINING OPERATIONS

(1) Air Pollution Control Plan

All pollutant emissions from the Lorencito Canyon Mine operation will be fugitive dust emissions, i.e., those emissions which could not reasonably pass through a stack, chimney, vent or any other functionally equivalent opening. The fugitive dust emissions will result from:

1. Vehicular traffic;
2. Drilling and blasting;
3. Coal and overburden removal;
4. Coal and overburden loading and dumping;
5. Slight wind erosion from benches; and
6. Active stockpile wind erosion.

No Air Pollution Control Permit is necessary due to the inactive status of the mine through Colorado Department of Health and Environment.
